

3-OX(ADI)AZOLYLPROPANOHYDROXAMIC ACIDS USEFUL AS PROCOLLAGEN C-
PROTEINASE INHIBITORS

CROSS-REFERENCE

5

This application is a divisional of United States Patent Application 10/021,721 filed on December 21, 2001, which claims the benefit of United States Provisional Application 60/262,355 filed on January 17, 2001, the contents of which are incorporated by reference.

10

This invention relates to a certain class of compounds, and the pharmaceutically acceptable salts, solvates and prodrugs thereof, which inhibit Procollagen C-proteinase ("PCP"). They are therefore useful in the treatment of mammals having conditions alleviable by inhibition of PCP. Especially of interest is an antiscarring treatment for wounds.

15

Fibrotic tissues, including dermal scars, are characterised by excessive accumulation of extracellular matrix, mainly collagen type I. It is thought that inhibition of collagen deposition will reduce formation of scar tissue. Collagen is secreted as the precursor, procollagen, which is transformed into the insoluble collagen by cleavage of the C-terminal propeptide by PCP. PCP is a zinc-dependent metalloprotease which is secreted from TGF- β -activated fibroblasts belonging to the subfamily of astacin-like proteases and able to cleave the C-terminal peptide of types I, II and III procollagens. Furthermore, data suggest that PCP activates lysyl oxidase, an enzyme essential for the formation of covalent cross-links which stabilise the fibrous form of collagen. Therefore, inhibition of PCP may not only reduce collagen deposition but may also make collagen more accessible for degradation.

25

Collagen is integral to, among other things, the proper formation of connective tissue. Thus, the over- or under-production of collagen or the production of abnormal collagen (including incorrectly processed collagen) has been linked with numerous connective tissue diseases and disorders. Mounting evidence suggests that PCP is an essential key enzyme for the proper maturation of collagen (see for example International Patent Application publication number WO 97/05865).

30

The present invention relates to substances capable of inhibiting PCP activity in order to regulate, modulate and/or reduce collagen formation and deposition. More specifically, the invention relates to the use of compounds and pharmaceutical compositions thereof for the treatment of various conditions relating to production of collagen.

35

At present more than nineteen types of collagens have been identified. These collagens, including fibrillar collagen types I, II, III are synthesized as procollagen precursor molecules

EU691337729US

which contain amino- and carboxy-terminal peptide extensions. These peptide extensions, referred to as "pro-regions," are designated as N- and C- propeptides, respectively.

The pro-regions are typically cleaved upon secretion of the procollagen triple helical precursor molecule from the cell to yield a mature triple helical collagen molecule. Upon cleavage, the "mature" collagen molecule is capable of association, for example, into highly structured collagen fibers. See e.g., Fessler and Fessler, 1978, *Annu. Rev. Biochem.* 47:129-162; Bornstein and Traub, 1979, in: *The Proteins* (eds. Neurath, H. and Hill, R.H.), Academic Press, New York, pp. 412-632; Kivirikko et al., 1984, in: *Extracellular Matrix Biochemistry* (eds. Piez, K.A. and Reddi, A.H.), Elsevier Science Publishing Co., Inc., New York, pp. 83-118; Prockop and Kivirikko, 1984, *N. Engl. J. Med.* 311:376-383; Kuhn, 1987, in: *Structure and Function of Collagen Types* (eds. Mayne, R. and Burgeson, R.E.), Academic Press, Inc., Orlando, Florida, pp. 1-42.

An array of conditions has been associated with the inappropriate or unregulated production of collagen, including pathological fibrosis or scarring, including endocardial sclerosis, idiopathic interstitial fibrosis, interstitial pulmonary fibrosis, perimuscular fibrosis, Symmers' fibrosis, pericentral fibrosis, hepatitis, dermatofibroma, cirrhosis such as biliary cirrhosis and alcoholic cirrhosis, acute pulmonary fibrosis, idiopathic pulmonary fibrosis, acute respiratory distress syndrome, kidney fibrosis/glomerulonephritis, kidney fibrosis/diabetic nephropathy, scleroderma/systemic, scleroderma/local, keloids, hypertrophic scars, severe joint adhesions/arthritis, myelofibrosis, corneal scarring, cystic fibrosis, muscular dystrophy (duchenne's), cardiac fibrosis, muscular fibrosis/retinal separation, esophageal stricture and Pyronie's disease. Further fibrotic disorders may be induced or initiated by surgery, including scar revision/plastic surgeries, glaucoma, cataract fibrosis, corneal scarring, joint adhesions, graft vs. host disease, tendon surgery, nerve entrapment, dupuytren's contracture, OB/GYN adhesions/fibrosis, pelvic adhesions, peridural fibrosis, restenosis. Other conditions where collagen plays a key role include burns, and chronic dermal ulcers which sometimes have a build-up of periulcer fibrosed material around them. Fibrosis of lung tissue is also observed in patients suffering from chronic obstructive airways disease (COAD) and asthma. One strategy for the treatment of these diseases and conditions is to inhibit the overproduction and/or deposition and/or unregulation of collagen. Thus, identification and isolation of molecules which control, inhibit and/or modulate the production and deposition of collagen are of major medical interest.

Recent evidence suggests that PCP is the essential key enzyme that catalyzes the cleavage of the Procollagen C-propeptide. This has been demonstrated in fibrillar collagens, including type I, type II, and type III collagen.

PCP was first observed in the culture media of human and mouse fibroblasts (Goldberg et al., 1975, *Cell* 4:45-50; Kessler and Goldberg, 1978, *Anal. Biochem.* 86:463-469), and chick tendon fibroblasts (Duskin et al., 1978, *Arch. Biochem. Biophys.* 185:326-332; Leung et al., 1979, *J. Biol. Chem.* 254:224-232). An acidic proteinase which removes the C-terminal propeptides from type I procollagen has also been identified (Davidson et al., 1979, *Eur. J. Biochem.* 100:551).

A partially purified protein having PCP activity was obtained from chick calvaria in 1982. Njieha et al., 1982, *Biochemistry* 23:757-764. In 1985, chicken PCP was isolated, purified and characterized from conditioned media of chick embryo tendons. Hojima et al., 1985, *J. Biol. Chem.* 260:15996-16003. Murine PCP has been subsequently purified from media of cultured mouse fibroblasts. Kessler et al., 1986, *Collagen Relat. Res.* 6:249-266; Kessler and Adar, 1989, *Eur. J. Biochem.* 186:115-121. Finally, the cDNA encoding human PCP has been identified, as set forth in the above-referenced articles and references disclosed therein.

Experiments conducted with these purified forms of chick and mouse PCP have indicated that the enzyme is instrumental in the formation of functional collagen fibers. Fertala et al., 1994, *J. Biol. Chem.* 269:11584.

As a consequence of the enzyme's apparent importance to collagen production, scientists have identified a number of PCP inhibitors. See e.g., Hojima et al., *supra*. For example, several metal chelators have demonstrated activity as PCP inhibitors. Likewise, chymostatin and pepstatin A were found to be relatively strong inhibitors of PCP. Additionally, α_2 -Macroglobuline, ovostatin, and fetal bovine serum appear to at least partially inhibit PCP activity.

Dithiothreitol, SDS, concanavalin A, Zn^{2+} , Cu^{2+} , and Cd^{2+} are similarly reported to be inhibitory at low concentrations. Likewise, some reducing agents, several amino acids, phosphate, and ammonium sulfate were inhibitory at concentrations of 1-10mM. Further, the enzyme was shown to be inhibited by the basic amino acids lysine and arginine (Leung et al., *supra*; Ryhänen et al., 1982, *Arch. Biochem. Biophys.* 215:230-235). Finally, high concentrations of NaCl or Tris-HCl buffer were found to inhibit PCP's activity. For example, it is reported that, with 0.2, 0.3, and 0.5M NaCl, the activity of PCP was reduced 66, 38, and 25%, respectively, of that observed with the standard assay concentration of 0.15M. Tris-HCl buffer in a concentration of 0.2-0.5M markedly inhibited activity (Hojima et al., *supra*). PCP activity and its inhibition have been determined using a wide array of assays. See e.g., Kessler and Goldberg, 1978, *Anal. Biochem.* 86:463; Njieha et al., 1982, *Biochemistry* 21:757-764. As articulated in numerous publications, the enzyme is difficult to isolate by conventional biochemical means and the identity of the cDNA sequence encoding such enzyme was not known until reported in the above references and related patent applications.

In view of its essential role in the formation and maturation of collagen PCP appears to be an ideal target for the treatment of disorders associated with the inappropriate or unregulated production and maturation of collagen.

- 5 The identification of effective compounds which specifically inhibit the activity of PCP to regulate and modulate abnormal or inappropriate collagen production is therefore desirable and the object of this invention.

- 10 Matrix metalloproteases (MMPs) constitute a family of structurally similar zinc-containing metalloproteases, which are involved in the remodelling, repair and degradation of extracellular matrix proteins, both as part of normal physiological processes and in pathological conditions.

- 15 Another important function of certain MMPs is to activate other enzymes, including other MMPs, by cleaving the pro-domain from their protease domain. Thus, certain MMPs act to regulate the activities of other MMPs, so that over-production in one MMP may lead to excessive proteolysis of extracellular matrix by another, e.g. MMP-14 activates pro-MMP-2

- 20 During the healing of normal and chronic wounds, MMP-1 is expressed by migrating keratinocytes at the wound edges (U.K. Saarialho-Kere, S.O. Kovacs, A.P. Pentland, J. Clin. Invest. 1993, 92, 2858-66). There is evidence which suggests MMP-1 is required for keratinocyte migration on a collagen type I matrix in vitro, and is completely inhibited by the presence of the non-selective MMP inhibitor SC44463 ((N4-hydroxy)-N1-[(1S)-2-(4-methoxyphenyl)methyl-1-((1R)-methylamino)carbonyl)]-(2R)-2-(2-methylpropyl)butanediamide) (B.K. Pilcher, J.A. Dumin, B.D. Sudbeck, S.M. Krane, H.G. Welgus, W.C. Parks, J. Cell Biol., 25 1997, 137, 1-13). Keratinocyte migration in vivo is essential for effective wound healing to occur.

- MMP-2 and MMP-9 appear to play important roles in wound healing during the extended remodelling phase and the onset of re-epithelialisation, respectively (M.S. Agren, Brit. J. 30 Dermatology, 1994, 131, 634-40; T. Salo, M. Mäkänen, M. Kylmäniemi, Lab. Invest., 1994, 70, 176-82). The potent, non-selective MMP inhibitor BB94 ((2S,3R)-5-methyl-3-[[[(1S)-1-(methylcarbamoyl)-2-phenylethyl]carbamoyl]-2-[(2-thienylthio)methyl]hexanohydroxamic acid, batimastat), inhibits endothelial cell invasion of basement membrane, thereby inhibiting angiogenesis (G. Tarboletti, A. Garofalo, D. Belotti, T. Drudis, P. Borsotti, E. Scanziani, P.D. 35 Brown, R. Giavazzi, J. Natl. Cancer Inst., 1995, 87, 293-8). There is evidence that this process requires active MMP-2 and/or 9.

Thus PCP inhibitors which significantly inhibit MMPs 1 and/or 2 and/or 9 would be expected to impair wound healing. MMP-14 is responsible for the activation of MMP-2, and thus inhibition of MMP-14 might also result in impaired wound healing.

- 5 For recent reviews of MMPs, see Zask et al, *Current Pharmaceutical Design*, 1996, 2, 624-661; Beckett, *Exp. Opin. Ther. Patents*, 1996, 6, 1305-1315; and Beckett et al, *Drug Discovery Today*, vol 1(no.1), 1996, 16-26.

- Alternative names for various MMPs and substrates acted on by these are shown in the table
10 below (Zask et al, *supra*).

Enzyme	Other names	Preferred substrates
MMP-1	Collagenase-1, interstitial collagenase	Collagens I, II, III, VII, X, gelatins
MMP-2	Gelatinase A, 72kDa gelatinase	Gelatins, collagens IV, V, VII, X, elastin, fibronectin; activates pro-MMP-13
MMP-3	Stromelysin-1	Proteoglycans, laminin, fibronectin, gelatins.
MMP-7	Pump, Matrilysin	Proteoglycans, laminin, fibronectin, gelatins, collagen IV, elastin, activates pro-MMP-1 and -2 .
MMP-8	Collagenase-2, neutrophil collagenase	Collagens I, II, III
MMP-9	Gelatinase B, 92 kDa gelatinase	Gelatins, collagens IV, V, elastin
MMP-12	Macrophage metalloelastase	Elastin, collagen IV, fibronectin, activates pro-MMP-2 & 3.
MMP-13	Collagenase-3	Collagens I, II, III, gelatins
MMP-14	MT-MMP-1	Activates pro-MMP-2 & 13, gelatins
MMP-15	MT-MMP-2	unknown
MMP-16	MT-MMP-3	Activates pro-MMP-2
MMP-17	MT-MMP-4	unknown

- International Patent Application publication number WO 01/47901 discloses a number of 3-heterocyclypropanohydroxamic acid PCP inhibitors.

15

International Patent Application publication number WO 95/23790 discloses a number of imidazole-substituted hydroxamic acid derivatives as MMP inhibitors, including collagenase inhibitors.

- 20 Yamamoto *et al*, in *J.Med.Chem.* (1998) 41, 1209 discloses a series of hydroxamic acid derivatives as MMP-1 inhibitors.

Dankhardt *et al*, in *Bioorg.Med.Chem Letters* (2000) 10, 2513 discloses various peptidic hydroxamic acid inhibitors of PCP.

25

According to one aspect of the present invention, there are provided compounds of formula (I):

10 wherein:

X is C₁₋₆ alkylene or C₂₋₆ alkenylene, each of which is optionally substituted by one or more fluorine atoms;

15 R is aryl or C₃₋₈ cycloalkyl optionally substituted by one or more fluorine atoms;

W is N or CZ;

Y is

20 (a) NR¹R³,

(b) C₁₋₄ alkyl substituted by NR¹R² or by a 4- to 7-membered N-heterocycle attached via the N-atom, which heterocycle optionally contains 1 or 2 further ring hetero-atoms independently selected from N, O and S, and which heterocycle is optionally substituted by one or more substituents independently selected from R², =O, OH, SO₂(C₁₋₄ alkyl) and/or C(O)_p(C₁₋₄ alkyl) groups,

25 or (c) a 4- to 7-membered saturated or partially or fully unsaturated N-heterocycle, which heterocycle optionally contains 1 or 2 further ring hetero-atoms independently selected from N, O and S, and which heterocycle is optionally substituted by one or more substituents independently selected from R², =O, OH, SO₂(C₁₋₄ alkyl) and/or C(O)_p(C₁₋₄ alkyl) groups,

30

Z is H or C₁₋₄ alkyl,

or when W is CZ, Y can be H or C₁₋₄ alkyl, and Z can be

(a) NR¹R³,

35 (b) C₁₋₄ alkyl substituted by NR¹R² or by a 4- to 7-membered N-heterocycle attached via the N-atom, which heterocycle optionally contains 1 or 2 further ring hetero-atoms independently selected from N, O and S, and which heterocycle is optionally substituted by one or more substituents independently selected from R², =O, OH, SO₂(C₁₋₄ alkyl) and/or C(O)_p(C₁₋₄ alkyl) groups,

or (c) a 4- to 7-membered saturated or partially or fully unsaturated N-heterocycle attached via the N-atom, which heterocycle optionally contains 1 or 2 further ring hetero-atoms independently selected from N, O and S, and which heterocycle is optionally substituted by one or more substituents independently selected from R^2 , =O, OH, $SO_2(C_{1-4} \text{ alkyl})$ and/or $C(O)_p(C_{1-4} \text{ alkyl})$ groups,

R^2 is H,

C_{1-6} alkyl (optionally substituted by one or more substituents independently selected from OH, C_{1-4} alkoxy, $C(O)_p(C_{1-4} \text{ alkyl, aryl, heteroaryl, or } NR^1R^3)$, $CONR^1R^3$ or NR^1R^3),

10 $SO_2(C_{1-4} \text{ alkyl, aryl, heteroaryl or } NR^1R^3)$,

$C(O)_p(C_{1-4} \text{ alkyl optionally substituted by } C_{1-4} \text{ alkoxy or } NR^1R^3)$,

$C(O)_p(C_{3-7} \text{ cycloalkyl})$,

$C(O)_p(\text{aryl})$,

$C(O)_p(\text{heteroaryl})$,

15 $CONR^1R^3$,

C_{3-7} cycloalkyl optionally substituted by one or more substituents independently selected from OH and C_{1-4} alkoxy,

a 4- to 7-membered saturated or partially or fully unsaturated heterocycle, which heterocycle ring contains up to 3 ring hetero-atoms independently selected from N, O and S, and which

20 heterocycle is optionally substituted by one or more substituents independently selected from R^3 , =O, OH, $SO_2(C_{1-4} \text{ alkyl})$ and/or $C(O)_p(C_{1-4} \text{ alkyl})$ groups, or aryl,

R^1 and R^3 are each independently selected from H and C_{1-4} alkyl optionally substituted by OH, NR^4R^5 or by C_{1-4} alkoxy,

25

R^4 and R^5 are each independently selected from H and C_{1-4} alkyl,

p is 1 or 2,

30

"aryl" is phenyl optionally substituted by one or more substituents independently selected from R^3 , OH, $SO_2(C_{1-4} \text{ alkyl})$ and/or $C(O)_p(C_{1-4} \text{ alkyl})$ groups,

"heteroaryl" is a 5- to 7-membered aromatic heterocycle with 1, 2 or 3 ring hetero-atoms

35 independently selected from N, O and S, and which ring is optionally substituted by one or more substituents independently selected from R^3 , =O, OH, $SO_2(C_{1-4} \text{ alkyl})$ and/or $C(O)_p(C_{1-4} \text{ alkyl})$ groups,

and the pharmaceutically acceptable salts, solvates (including hydrates) and prodrugs thereof.

"Alkyl", "alkylene", "alkoxy", "alkanoyl", and "alkenylene" groups, including in groups incorporating said moieties, may be straight chain or branched where the number of carbon atoms allows.

5

Halogen is taken to mean fluorine, chlorine, bromine or iodine.

Pharmaceutically-acceptable salts are well known to those skilled in the art, and for example include those mentioned in the art cited above, and by Berge et al, in J.Pharm.Sci., 66, 1-19
10 (1977). Suitable acid addition salts are formed from acids which form non-toxic salts and include the hydrochloride, hydrobromide, hydroiodide, nitrate, sulphate, bisulphate, phosphate, hydrogenphosphate, acetate, trifluoroacetate, gluconate, lactate, salicylate, citrate, tartrate, ascorbate, succinate, maleate, fumarate, gluconate, formate, benzoate, methanesulphonate, ethanesulphonate, benzenesulphonate, pamoate, camsylate, and p-toluenesulphonate salts.

15

Pharmaceutically acceptable base addition salts are well known to those skilled in the art, and for example include those mentioned in the art cited above, and can be formed from bases which form non-toxic salts and include the aluminium, calcium, lithium, magnesium, potassium, sodium and zinc salts, and salts of non-toxic amines such as diethanolamine.

20

Certain of the compounds of formula (I) may exist in one or more zwitterionic forms. Certain of the compounds of formula (I) may exist in one or more tautomeric forms. Certain of the compounds of formula (I), their salts, solvates, prodrugs, etc. may exist in one or more polymorphic forms. It is to be understood that the compounds of formula (I) include all such
25 zwitterions, tautomers and polymorphs..

The compounds of formula (I), their salts, hydrates, prodrugs etc. can exhibit isotopic variation, e.g. forms with enriched ^2H , ^3H , ^{13}C , ^{14}C , ^{15}N , ^{18}O , etc. may be prepared, for example by suitable variation of the synthetic methods described herein using methods and reagents known in the
30 art or routine modification thereof. All such isotopic variants are included in the scope of the invention.

Prodrug moieties are well-known to those skilled in the art (see for example the article by H Feres, in *Drugs of Today*, vol 19, no.9 (1983) pp.499-538, especially section A1), and for
35 example include those specifically mentioned in A.A. Sinkula's article in *Annual Reports in Medicinal Chemistry*, vol 10, chapter 31, pp.306-326, herein incorporated by reference, and the references therein. Specific prodrug moieties which may be specifically mentioned are aliphatic-aromatic, carbonate, phosphate and carboxylic esters, carbamates, peptides, glycoside,

acetals and ketals, tetrahydropyranyl and silyl ethers. Such prodrug moieties can be cleaved in situ, e.g. are hydrolysable in physiological conditions, to give compounds of formula (I).

Certain of the compounds of the formula (I) may exist as geometric isomers. The compounds of the formula (I) may possess one or more asymmetric centres, apart from the specified centres in formula (I), and so exist in two or more stereoisomeric forms. The present invention includes all the individual stereoisomers and geometric isomers of the compounds of formula (I) and mixtures thereof.

Preferably the compounds of formula (I) have the following stereochemistry (IA):

20
Preferably W is N.

Preferably X is a linear C₂₋₆ alkylene moiety optionally substituted by one or more fluorine atoms. More preferably X is propylene.

25
Preferably R is C₃₋₈ cycloalkyl optionally substituted by one or more fluorine atoms. More preferably R is cyclobutyl, cyclopentyl or cyclohexyl optionally substituted by one or more fluorine atoms. Most preferably R is cyclohexyl.

30
Preferably Y is C₁₋₄ alkyl substituted by NR¹R², or Y is a 4- to 7-membered saturated or partially or fully unsaturated N-heterocycle, which heterocycle optionally contains 1 or 2 further ring hetero-atoms independently selected from N, O and S, and which heterocycle is optionally substituted by one or more substituents independently selected from R², =O, OH, SO₂(C₁₋₄ alkyl) and/or C(O)_p(C₁₋₄ alkyl) groups.
35
More preferably Y is CH₂ substituted by NR¹R², or Y is a 6-membered saturated or partially or fully unsaturated N-heterocycle, and which heterocycle is optionally substituted by one or more substituents independently selected from R², =O, OH, SO₂(C₁₋₄ alkyl) and/or C(O)_p(C₁₋₄ alkyl) groups.

Yet more preferably Y is $\text{CH}_2\text{N}(\text{H or CH}_3)(\text{SO}_2(\text{C}_{1-4} \text{ alkyl, aryl, heteroaryl or NR}^1\text{R}^3))$, or Y is a 6-membered saturated or partially or fully unsaturated N-heterocycle, and which heterocycle is optionally substituted by $\text{SO}_2(\text{C}_{1-4} \text{ alkyl})$ and/or $\text{C}(\text{O})_p(\text{C}_{1-4} \text{ alkyl})$ groups.

Further more preferably Y is $\text{CH}_2\text{NHSO}_2(\text{C}_{1-4} \text{ alkyl})$, or Y is a 6-membered saturated N-

5 heterocycle, and which heterocycle is optionally substituted by $\text{SO}_2(\text{C}_{1-4} \text{ alkyl})$ or $\text{C}(\text{O})_p(\text{C}_{1-4} \text{ alkyl})$.

Most preferably Y is $\text{CH}_2\text{NHSO}_2\text{CH}_3$ or methylsulphonylpiperidinyl.

Preferably Z is H or CH_3 .

10

A preferred group of compound of formula (I) are those wherein each substituent is as specified in the Examples below.

Another preferred group are the compounds of the Examples below and the salts, solvates and
15 prodrugs thereof.

A further aspect of the invention is a PCP inhibitor of formula (I) which is selective against MMP-1 and/or MMP-2 and/or MMP-9 and/or MMP-14.

20 A further aspect of the invention is the use of a PCP inhibitor of formula (I) which is selective against MMP-1 and/or MMP-2 and/or MMP-9 and/or MMP-14 in medicine.

Further related to this aspect of the invention is the use of a PCP inhibitor of formula (I) which is selective against MMP-1 and/or MMP-2 and/or MMP-9 and/or MMP-14 in the manufacture of an antiscarring medicament.

25 Further related to this aspect of the invention is a method of treating a condition mediated by PCP and in which MMP-1 and/or MMP-2 and/or MMP-9 and/or MMP-14 have a beneficial effect, with an effective amount of PCP inhibitor of formula (I) which is selective against MMP-1 and/or MMP-2 and/or MMP-9 and/or MMP-14, an example of such a condition being a wound. Preferably the PCP inhibitor of formula (I) mentioned in this aspect of the invention is selective against at least MMP-1, MMP-2 and MMP-9.

30 Most preferably the said PCP inhibitor of formula (I) is selective against MMP-1, MMP-2, MMP-9, and MMP-14.

Preferably the said selective PCP inhibitor of formula (I) has an IC_{50} vs. PCP of $0.5\mu\text{M}$ or lower, and selectivities vs. MMP-2 and MMP-9 of at least 30-fold, in the tests described herein.

35 Preferably the selective PCP inhibitor of formula (I) has an IC_{50} vs. PCP of $0.1\mu\text{M}$ or lower, and selectivities vs. MMP-1, MMP-2, MMP-9 and MMP-14 of at least 300-fold, in the tests described herein.

Another aspect of the invention is a substance of formula (I) described herein, including the salts, solvates and prodrugs thereof, for use in medicine.

Another aspect of the invention is the use of the substances of formula (I) described herein, including the salts, solvates and prodrugs thereof, in the manufacture of a medicament for treatment of a PCP-mediated condition (e.g. an antiscarring medicament).

5

Another aspect of the invention is a pharmaceutical composition comprising a compound of formula (I), salts thereof, solvates thereof and/or prodrugs thereof, and a pharmaceutically acceptable diluent, carrier or adjuvant.

10 Another aspect of the invention is the combination of a compound of formula (I), or a salt, solvate or prodrug thereof, with one or more other active agent useful in treating wounds, such as:

(i) a growth factor such as TGF- β -3 (Renovo), IGF-1 (Genentech), IGF-1 complex (Celtrix), KGF-2 or FGF-10 (Sumitomo), DWP-401/EGF (Daewoong) or SNK-863 (Sanwa Kagaku

15 Kenkyusho);

(ii) a growth factor agonist such as Noggin (Regeneron);

(iii) a growth factor antibody/antisense material, such as those to: TGF- β -1 or 2 (Renovo, CaT), PDGF (Il Yang) or CTGF (Fibrogen);

(iv) a hormone such as DHEAS (Pharmadigm), ConXn / Relaxin (Connetics);

20 (v) an antibody to adhesion compounds such as ICAM-1 (Boehringer);

(vi) a MMP beneficial to healing of wounds, such as Collagenase ABC (BioSpecifics);

(vii) a barrier such as ADCON (Gliatech);

(viii) skin products such as artificial skin systems such as those based on DermaGraft (Advanced Tissue Sciences Inc.), INTEGRA Artificial Skin (Integra Life Sciences Holding Corp.), cell cultures such as Apligraf / Graftskin (Novartis), those developed by Cell Genesys Inc., AlloDerm (LifeCell) or matrix formulation products such as Argidene gel (Telios Pharmaceuticals Inc.);

25

(ix) a uPA inhibitor such as those disclosed in patent applications WO 99/20608, WO 00/05214 and EP 1 044 967; and/or

30

(x) a MMP-3 inhibitor such as those disclosed in patent applications WO99/35124, WO 99/29667, EP 0 931 788 and WO 00/74681.

Yet another aspect of the invention is a method of treatment of a condition mediated by PCP comprising administration of a therapeutically-effective amount of a substance according to the above definitions.

35

It is to be appreciated that reference to treatment includes prophylaxis as well as the alleviation of established symptoms of PCP-mediated conditions and diseases.

- The invention further provides Methods for the production of compounds of the invention, which are described below and in the Examples and Preparations. The skilled man will appreciate that the compounds of the invention could be made by methods other than those specifically described herein, by adaptation of the methods herein described in the sections below and/or adaptation thereof, for example by methods known in the art. Suitable guides to synthesis, functional group transformations, use of protecting groups, etc. are, for example, "Comprehensive Organic Transformations" by RC Larock, VCH Publishers Inc. (1989), "Advanced Organic Chemistry" by J March, Wiley Interscience (1985), "Designing Organic Synthesis" by S Warren, Wiley Interscience (1978), "Organic Synthesis - The Disconnection Approach" by S Warren, Wiley Interscience (1982), "Guidebook to Organic Synthesis" by RK Mackie and DM Smith, Longman (1982), "Protective Groups in Organic Synthesis" by TW Greene and PGM Wuts, John Wiley and Sons Inc. (1999), and PJ Kocienski, in "Protecting Groups", Georg Thieme Verlag (1994), and any updated versions of said standard works.
- 15 In the Methods below, unless otherwise specified, the substituents are as defined above with reference to the compounds of formula (I) above.

The compounds of formula (I) where W is N can be prepared according to the chemistry outlined in the schemes below.

The hydroxamic acid compounds of formula (I) where W is N can be made by reaction of the corresponding activated acid derivative of formula (II), where L⁻ is a suitable leaving group, with hydroxylamine.

Suitable leaving groups are generally those which would leave in a more efficient manner than the hydroxide of the parent acid (IV), in a nucleophilic substitution reaction, such as a halide, C₁₋₄ alkoxide optionally substituted by halogen, an alkylsulphonate such as methylsulphonate or mesylsulphonate, an arylsulphonate such as p-tosylsulphonate. Other suitable leaving groups are familiar to those working in the field of amino acid coupling.

Such compounds of formula (II) may be made via standard chemistry from the corresponding acid (IV). Compounds of formula (II) where L is a leaving group such as Cl, Br, I, OCO(C₁₋₄ alkyl optionally substituted by one or more halogen), mesylate, tosylate, and the like, can be made from

the corresponding compound of formula (II) where L is OH by conventional methods, using an acid-activating agent including methods typified in e.g. Examples 1-6, etc.

A coupling agent such as a diimide coupling agent, e.g. carbonyldiimidazole or N,N'-

- 5 dicyclohexylcarbodiimide, may be used to convert compounds of formula (IV) to compounds of formula (I) (see e.g. Examples 7,19), under standard conditions with the agents mentioned previously, e.g. via intermediates of formulae (II) and/or (III).

The hydroxylamine used in this reaction can be suitably generated in situ by treatment of a

- 10 hydroxylamine salt such as the hydrochloride salt with a suitable base such as triethylamine. Suitably the reaction is carried out in a polar solvent such as DMF.

This reaction, leaving groups, solvents, reagents, etc. are exemplified below in the relevant Examples below.

- 15 Alternatively the compounds of formula (I) may be made from a NHO-protected compound of formula (III), where P is a suitable O-protecting group, by suitable deprotection.

Suitable O-protecting groups can be found in the text by Greene and Wuts, *supra*, and include trialkylsilyl (such as trimethylsilyl), benzyl, etc.

Compounds of formula (III) can be made in an analogous manner to the compounds of formula (I) from the compounds of formula (II), using a protected hydroxylamine PONH_2 or a suitable salt thereof in place of hydroxylamine itself or the hydroxylamine salt.

- 20 The deprotection method is determined by the protective group used, as is well known in the art (see e.g. Greene and Wuts, *supra*). E.g. benzyl groups may be hydrogenated, suitably using a catalytic transfer hydrogenation method. The reagents and conditions for reaction (III) \rightarrow (I) are typified in certain of the Examples below, such as where a protected hydroxylamine reagent (e.g. O-trimethylsilylhydroxylamine) can be used (e.g. Examples 1-6, etc.), where conveniently the deprotection is carried out in the same vessel as the previous step.

- 30 Other methods of making hydroxamic acids (I) are known and may be used, e.g. those mentioned in the text by J. March, *supra*, chapters 0-54, 0-57 and 6-4, and relevant references therein.

Acids of formula (IV) may be made by deprotection of the O-protected species of formula (V).

Suitable O-protecting groups can be found in the chapter on O-protection in the book by Greene and Wuts, *supra*, and include C_{1-4} alkoxy such as t-butoxy (as typified in Preparations 4, 7, 9, 11, 13, 15, etc.), benzyloxy, trialkylsilyloxy such as trimethylsilyloxy, etc..

- 35 The deprotection method is determined by the protective group used, as is well known in the art (see Greene and Wuts, *supra*). E.g. benzyl groups may be removed by hydrogenation, suitably using a catalytic transfer hydrogenation method, t-butyl groups may be removed by treatment with an acid in a suitable solvent, such as trifluoroacetic acid in dioxan, hydrochloric acid in toluene, etc.

Compounds of formula (V), e.g. where P is a t-butoxy can be made for example by condensation reaction of a corresponding compound of formula (VI), for example by heating to elevated temperature in an inert solvent such as in xylene at about 130°C, this reaction being typified by

5 Preparation 3, 32, etc. below.

Compounds of formula (VI) can be made for example by coupling an acid of formula (VII) with a reagent of formula $C(NH_2)(Y)=NOH$, which is available via literature methods or adaptation thereof in a conventional manner (see e.g. Preparation 1), such as typified in methods described herein (e.g. see Preparation 2, etc.). Typically the condensation is carried out by adding a solution of the acid (VII) in a suitable inert solvent such as 1,4-dioxane or dichloromethane or the like, to a suitable agent such as 1-hydroxybenzotriazole hydrate, followed by addition of a suitable coupling agent such as a carbodiimide coupling agent, e.g. N,N'-dicyclohexylcarbodiimide, then treatment with the reagent $C(NH_2)(Y)=NOH$. Suitably the coupling is carried out at ambient temperature.

15

Compounds of formula (VII), and salts thereof which can generate the acid in situ on acidification, can be made by hydrogenation of the corresponding itaconate derivative, which in turn can be made by conventional methods such as the Stobbe condensation (see e.g. Preparation 168).

Compounds of formula (VII) where R is cyclohexyl can be made by catalytic hydrogenation of the corresponding compound of formula (I) where R is phenyl, using suitable catalysts and conditions, such as those mentioned in Preparation 168 (in part).

20

The compounds of formula (I), where W is CZ, can be prepared according to the chemistry outlined in the scheme below:

The hydroxamic acid compounds of formula (I) where W is CZ can be made by reaction of the
 5 corresponding activated acid derivative of formula (IX), where L⁻ is a suitable leaving group, with
 hydroxylamine. The leaving groups, reagents, etc. are the same as those mentioned above in
 relation to the corresponding compounds of formula (I) where W is N.

Such compounds of formula (IX) may be made via standard chemistry from the corresponding acid
 10 (X) using the same or similar chemistry to that outlined above in relation to the corresponding
 compounds of formula (II) where W is N (*supra*).

Alternatively the compounds of formula (I) may be made from a NHO-protected compound of
 formula (VIII), where P is a suitable O-protecting group, by suitable deprotection.
 15 Suitable O-protecting groups can be found in the text by Greene and Wuts, *supra*, and include
 trialkylsilyl (such as trimethylsilyl), benzyl, etc.

Compounds of formula (VIII) can be made in an analogous manner to the compounds of formula (II) from the compounds of formula (II), using a protected hydroxylamine PONH_2 or a suitable salt thereof in place of hydroxylamine itself or the hydroxylamine salt.

The deprotection method is determined by the protective group used, as is well known in the art.

- 5 E.g. benzyl groups may be hydrogenated, suitably using a catalytic transfer hydrogenation method. The reagents and conditions for reaction (VIII) \rightarrow (I) are typified in Examples 68-72 below.

Other methods of making hydroxamic acids (I) are known and may be used, e.g. those mentioned in the text by J. March, *supra*, chapters 0-54, 0-57 and 6-4, and relevant references therein.

10

Acids of formula (X) may be made by deprotection of the O-protected species of formula (XI).

Suitable O-protecting groups can be found in the chapter on O-protection in the book by Greene and Wuts, *supra*, and include C_{1-4} alkoxy such as t-butoxy (as typified by the conditions mentioned in Preparation 4, etc.), benzyloxy, trialkylsilyloxy such as trimethylsilyloxy, etc..

- 15 The deprotection method is determined by the protective group used, as is well known in the art (see Greene and Wuts, *supra*). E.g. benzyl groups may be removed by hydrogenation, suitably using a catalytic transfer hydrogenation method, t-butyl groups may be removed by treatment with an acid such as trifluoroacetic acid, etc.

- 20 Compounds of formula (XI), e.g. where P is a t-butoxy group can be made for example by oxidation of a compound of formula (XII). Suitably the oxidation is carried out using copper (II) bromide with hexamethylenetetramine and a base such as DBU.

Compounds of formula (XII) may be made by condensation of compounds of formula (XIII), for example by treatment of the compound of formula (XIII) with a suitable agent such as Burgess Reagent, in an anhydrous solvent such as THF.

25

Compounds of formula (XIII) may be made by condensation of the acid of formula (II) above with an agent of formula $\text{NH}_2\text{CH}(\text{Y})\text{CH}(\text{Z})\text{OH}$. Compounds of formula $\text{NH}_2\text{CH}(\text{Y})\text{CH}(\text{Z})\text{OH}$ are available commercially, from the literature or by routine modification thereof.

30

Alternatively, compounds of formula (XI) may be made by condensation of compounds of formula (XIV) (see for example, Preparation 173):

(XIV)

where Y' is a precursor moiety which can undergo functional group transformation to give Y as defined earlier to give compounds of formula (XI).

- 5 Certain other of the intermediates mentioned earlier (en route to compounds of formula (I) where W is N or CZ) can incorporate a Y' moiety instead of the Y moiety, which Y' moiety can undergo suitable functional group transformations at a suitable juncture at some point in the synthetic sequence to give intermediates or final compounds of formula (I) where the Y group is present as defined above.
- 10 Some specific routes to compounds of formula (I) (where X is propylene and R is cyclohexyl) are outlined in the following schemes, and with reference to certain Examples mentioned below, as further illustrations of the methods of preparation. As the skilled reader will recognise immediately, in these schemes the "Y" substituent in formula (I) above is designated in a different manner. The chemistry mentioned below can readily be extrapolated to give certain other compounds of formula
- 15 (I) as defined above.

In the scheme below, W is N, and the Y substituent is represented as R:

Examples 1, 12-14, 29, 53-55, 67

(a), HONH_2 ; (b), CDI or WSCDI/HOBt; (c), Xylene 130°C ; (d), TFA; (e), $\text{iBuOCOC}\text{Cl}$ or CDI, then TMSONH_2 , then MeOH.

The scheme below illustrates synthesis of certain compounds where W is N and Y is an amine moiety (NB The functional group interconversions could equally be applied to the corresponding oxazoles (i.e. where W is CZ)):

5

(a), NaBH_4 ; (b), TsCl ; (c), NH_3 ; (d), TFA ; (e), BOC-on ; (f), iBuOCOC or CDI , then TMSONH_2 , then MeOH ; (g), NHR_1R_2 .

The scheme below represents a general route to compounds where W is N and Y incorporates a certain sulfonamide, amide, or urea moiety (NB again this chemistry will be equally applicable to the corresponding oxazole compounds, i.e. where W is CZ):

(a) AcCl; (b) $\text{O}=\text{C}(\text{OSuc})_2$, $\text{R}'\text{R}''\text{NH}$; (c) $\text{ClSO}_2\text{NHtBu}$; (d) $\text{R}'\text{SO}_2\text{Cl}$; (e) $\text{Cl}(\text{CH}_2)_3\text{SO}_2\text{Cl}$; (f) TFA;
 (g) iBuOCOC or CDI, then TMSNH_2 , then MeOH; (h) NaOMe

The scheme below represents a general route to compounds where W is N and Y incorporates certain amide moieties (NB again this chemistry will be equally applicable to the corresponding oxazole compounds, i.e. where W is CZ):

Examples 48,49,59-61

5

(a), $\text{BrCH}_2\text{CO}_2\text{Me}$ or $\text{BrCH}_2\text{CONH}_2$; (b) TFA; (c) $\text{iBuOCOC}\text{Cl}$ or CDI, then TMSONH_2 , then MeOH. (d) LiOH, (e) $\text{R}'\text{R}''\text{NH}$, WSCDI, HOBT.

10

The scheme below represents a general route to compounds where W is CZ and Y incorporates an amine moiety (NB the latter stages of this chemistry will be equally applicable to the corresponding oxadiazole compounds, i.e. where W is N):

Examples 68-70

5

(a) HOBT, WSCDI; (b) Burgess reagent; (c) CuBr₂, DBU; (d) TFA; (e) BnONH₂, HOBT, WSCDI; (f) DIBAL; (g) R'R''NH, NaHB(OAc)₃, (h) H₂, Pd(OH)₂/C

10 Similar types of chemistry were used in the preparation of the compounds of Examples 71 and 72.

It will be apparent to those skilled in the art that other protection and subsequent deprotection regimes during synthesis of a compound of the invention may be achieved by conventional techniques, for example as described in the volumes by Greene and Wuts, and Kocienski, *supra*.

5 Where desired or necessary the compound of formula (I) is converted into a pharmaceutically acceptable salt thereof. A pharmaceutically acceptable salt of a compound of formula (I) may be conveniently be prepared by mixing together solutions of a compound of formula (I) and the desired acid or base, as appropriate. The salt may be precipitated from solution and collected by filtration, or may be collected by other means such as by evaporation of the solvent.

10

Certain compounds of the invention may be interconverted into certain other compounds of the invention by methods mentioned in the Examples and Preparations, and well-known methods from the literature.

15 Compounds of the invention are available by either the methods described herein in the Methods, Examples and Preparations or suitable adaptation thereof using methods known in the art. It is to be understood that the synthetic transformation methods mentioned herein may be carried out in various different sequences in order that the desired compounds can be efficiently assembled. The skilled chemist will exercise his judgement and skill as to the most
20 efficient sequence of reactions for synthesis of a given target compound.

The compounds, salts, solvates and prodrugs of the invention may be separated and purified by conventional methods.

25 Separation of diastereomers may be achieved by conventional techniques, e.g. by fractional crystallisation, chromatography or H.P.L.C. of a stereoisomeric mixture of a compound of formula (I) or a suitable salt or derivative thereof. An individual enantiomer of a compound of formula (I) may also be prepared from a corresponding optically pure intermediate or by resolution, such as by H.P.L.C. of the corresponding racemate using a suitable chiral support or
30 by fractional crystallisation of the diastereomeric salts formed by reaction of the corresponding racemate with a suitably optically active acid or base. In certain cases preferential crystallisation of one of the enantiomers can occur from a solution of a mixture of enantiomers, thus enriching the remaining solution in the other enantiomer.

35 For human use, the compounds of formula (I) or their salts can be administered alone, but will generally be administered in admixture with a pharmaceutically acceptable diluent or carrier selected with regard to the intended route of administration and standard pharmaceutical practice.

For example, they can be administered orally, including buccally and sublingually. The compounds or salts can be injected parenterally, for example, intravenously, intradermally intramuscularly or subcutaneously. They can be administered topically and/or transdermally. The compound or salt could also be administered intraocularly for ophthalmic use. For certain
5 uses, vaginal, rectal and nasal (e.g. by inhalation of a dry powder or aerosol) administration would be suitable.

Formulations may be of immediate-, delayed-, modified-, sustained-, pulsed- or controlled-release type, and may be sterile or preserved or self-preserving.

10

Suitable formulations for oral administration would include tablets containing such excipients as starch or lactose, capsules or ovules either alone or in admixture with excipients, or in the form of elixirs, solutions or suspensions containing flavouring or colouring agents. The compound or salt could be incorporated into capsules or tablets for targetting the colon or duodenum via
15 delayed dissolution of said capsules or tablets for a particular time following oral administration. Dissolution could be controlled by susceptibility of the formulation to bacteria found in the duodenum or colon, so that no substantial dissolution takes place before reaching the target area of the gastrointestinal tract.

20 The compounds or salts can be administered parenterally, by injection for example, intravenously, intradermally intramuscularly or subcutaneously. For parenteral administration, they are best used in the form of a sterile, preserved or self-preserving aqueous solution or suspension which may contain other substances, for example, enough salt or glucose to make the solution isotonic with blood. The compounds or salts may be used in combination with
25 cyclodextrins. By injection we include standard injection techniques, and also needlefree injector or implant injection techniques.

The compounds or salts can be administered topically, and/or transdermally, in the form of sterile or preserved or self-preserving creams, gels, suspensions, lotions, solutions, sponges,
30 fibres, microemulsions, films, ointments, dusting powders, sprays, foams, mousses, drug-incorporated dressings, skin patches, ointments such as petrolatum or white soft paraffin based ointments or via a skin patch or other device. They could be administered directly onto a wound. The compounds or salts may be delivered using iontophoresis, electroporation, phonophoresis and sonophoresis. They could be incorporated into a coated suture. For example they can be
35 incorporated into a lotion or cream consisting of an aqueous or oily emulsion of mineral oils; sorbitan monostearate; polysorbate 60; cetyl esters wax; cetearyl alcohol; 2-octyldodecanol; benzyl alcohol; water; polyethylene glycols and/or liquid paraffin, or they can be incorporated into a suitable ointment consisting of one or more of the following - mineral oil; liquid petrolatum; white petrolatum; propylene glycol; polyoxyethylene polyoxypropylene compound; emulsifying

- wax and water, or as a gel such as a hydrogel with cellulose or polyacrylate derivatives or other viscosity modifiers, or as a dry powder or liquid spray or aerosol with butane/propane, HFA, CFC, CO₂ or other suitable propellant, optionally also including a lubricant such as sorbitan trioleate, or as a drug-incorporated dressing either as a tulle dressing, with white soft paraffin or polyethylene glycols impregnated gauze dressings or with a gel such as a hydrogel, hydrocolloid, alginate or film dressings. The compound can be dissolved or suspended in, for example, water, appropriate buffers, alcohols (e.g. ethanol, isopropyl alcohol, benzyl alcohol), glycols (e.g. propylene glycol, glycerol, polyethylene glycols), diethylene glycol ethers, poloxamers (polyoxyethylene polyoxypropylene compounds), isopropylmyristate, isopropylpalmitate, fixed oils (e.g. castor oil), mineral oil, silicone oils (e.g. dimeticone), other synthetic mono-/di-/triglycerides, fatty acids, liquid petrolatum, white petrolatum, liquid paraffin, emulsifying wax, sorbitan monostearate, polysorbates, cetostearyl alcohol, cetyl alcohol, 2-octyldodecanol or combinations thereof. Suitable viscosity modifiers, for example cellulose or polyacrylate derivatives can also be incorporated.
- Penetration enhancers may also be used.

The compound or salt could also be administered intraocularly for ophthalmic use e.g. in a lens implant, ointment, micronised suspension, absorbable gel sponges, implants, particulate or vesicular systems such as niosomes or liposomes, or as an eye drop with appropriate buffers, viscosity modifiers (e.g. cellulose or polyacrylate derivatives), preservatives (e.g. benzalkonium chloride (BZK)) and agents to adjust tonicity (e.g. sodium chloride). The compound may be used in combination with cyclodextrins. In addition, compounds may be delivered by iontophoresis. Such formulation techniques are well-known in the art.

- For certain uses, vaginal, rectal and nasal (e.g. by inhalation of a dry powder or aerosol) administration would be suitable.

All such formulations may also contain auxiliaries such as appropriate stabilisers, preservatives such as antioxidants and chelating agents, flavours, colourings, cyclodextrins, etc. Such auxiliaries are well-known in the formulation art and the skilled person will be able to choose from such auxiliaries based on the properties of the compound or salt to be administered, the administration route, etc.

For oral and parenteral administration to human patients, the daily dosage level of the compounds of formula (I) or their salts or prodrugs will be from 0.001 to 20, preferably from 0.01 to 20, more preferably from 0.1 to 10, and most preferably from 0.5 to 5 mg/kg with respect to the active compound (in single or divided doses). Thus tablets or capsules of the compounds will contain from 0.1 to 500, preferably from 50 to 200, mg of active compound for administration singly or two or more at a time as appropriate.

For topical administration to human patients with acute/surgical wounds or scars, the daily dosage level of the compounds, in suspension or other formulation, could be from 0.01 to 50mg/ml, preferably from 0.3 to 30 mg/ml.

5

For treatment of a wound, the dosage will vary with the size of the wound, whether or not the wound is open or closed or partially closed, and whether or not the skin is intact.

The physician in any event will determine the actual dosage which will be most suitable for an individual patient and it will vary with the condition to be treated, the age, weight and response of the particular patient, as well as the efficacy of the drug compound. The above dosages are exemplary of the average case; there can of course be individual instances where higher or lower dosage ranges are merited, and such are within the scope of this invention.

15 Biological Test Methods

PCP Inhibition

In order to determine potency of PCP inhibitors a fluorogenic PCP cleavage assay was used. This assay is based on the template of Beekman et al. (FEBS Letters (1996), 390: 221-225) using a fluorogenic substrate. The substrate (Dabcyl-Arg-Tyr-Tyr-Arg-Ala-Asp-Asp-Ala-Asn-Val-Glu(EDANS)-NH₂) contains the cleavage site of human PCP (Hojima et al., J Biol Chem (1985), 260: 15996-16003). Human PCP has been purified from supernatant of stable transfected CHO cells using hydrophobic interaction column followed by Superdex 200 gel filtration. 4 µg total protein of this enzyme preparation was incubated with various concentrations of the substance to be tested and 3x 10⁻⁶ M substrate in assay buffer (50 mM Tris-Base, pH 7.6 containing 150 mM NaCl, 5 mM CaCl₂, 1µM ZnCl₂ and 0.01 % Brij 35). The assay was performed in 96-well black fluorimeter plates and fluorescence was read continuously in a fluorimeter over 2.5 hours (λ_{ex} = 340 nm, λ_{em} = 485 nm) at a constant 37°C with shaking. Release of the fluorogenic signal was in linear correlation to PCP activity. Reading of the mean velocity from 30 min after start of experiment until 2.5 hours was calculated by the Biolise software. IC₅₀ values were calculated by

plotting % inhibition values against compound concentration using Tessela add in for Excel spreadsheet. Example compounds were tested and were found to have IC₅₀ values vs. PCP of 1µM or less.

MMP Inhibition

The ability of compounds to inhibit the cleavage of fluorogenic peptides by MMPs 1, 2, 9, and 14 is described below.

The assays for MMPs 2, 9, and 14 are based upon the original protocol described by Knight et al. (Fed.Euro.Biochem.Soc., 296 (3), 263-266; 1992) with the slight modifications given below.

5

Inhibition of MMP-1

(i) Enzyme Preparation

Catalytic domain MMP-1 was prepared at Pfizer Central Research. A stock solution of MMP-1
10 (1µM) was activated by the addition of aminophenylmercuric acetate (APMA), at a final concentration of 1mM, for 20 minutes at 37°C. MMP-1 was then diluted in Tris-HCl assay buffer (50mM Tris, 200mM NaCl, 5mM CaCl₂, 20µM ZnSO₄, 0.05% Brij 35) pH 7.5 to a concentration of 10nM. The final concentration of enzyme used in the assay was 1nM.

15 (ii) Substrate

The fluorogenic substrate used in this assay was Dnp-Pro- β -cyclohexyl-Ala-Gly-Cys(Me)-His-Ala-Lys(N-Me-Ala)-NH₂ as originally described by Bickett et al (Anal. Biochem, 212, 58-64, 1993). The final substrate concentration used in the assay was 10µM.

20 (iii) Determination of Enzyme Inhibition

Test compounds were dissolved in dimethyl sulphoxide and diluted with assay buffer so that no more than 1% dimethyl sulphoxide was present. Test compound and enzyme were added to each well of a 96 well plate and allowed to equilibrate for 15 minutes at 37°C in an orbital shaker prior to the addition of substrate. Plates were then incubated for 1 hour at 37°C prior to
25 determination of fluorescence (substrate cleavage) using a fluorimeter (Fluostar; BMG LabTechnologies, Aylesbury, UK) at an excitation wavelength of 355nm and emission wavelength of 440nm. The potency of inhibitors was measured from the amount of substrate cleavage obtained using a range of test compound concentrations, and, from the resulting dose-response curve, an IC₅₀ value (the concentration of inhibitor required to inhibit 50% of the
30 enzyme activity) was calculated.

Inhibition of MMP-2 and MMP-9

(i) Enzyme Preparation

35 Catalytic domain MMP-2 and MMP-9 were prepared at Pfizer Central Research. A stock solution of MMP-2 / MMP-9 (1µM) was activated by the addition of aminophenylmercuric acetate (APMA). For MMP-2 and MMP-9, a final concentration of 1mM APMA was added, followed by incubation for 1 hour at 37°C. The enzymes were then diluted in Tris-HCl assay

buffer (100mM Tris, 100mM NaCl, 10mM CaCl₂ and 0.16% Brij 35, pH 7.5), to a concentration of 10nM. The final concentration of enzyme used in the assays was 1nM.

(ii) Substrate

The fluorogenic substrate used in this screen was Mca-Arg-Pro-Lys-Pro-Tyr-Ala-Nva-Trp-Met-Lys(Dnp)-NH₂ (Bachem Ltd, Essex, UK) as originally described by Nagase et al (J.Biol.Chem., 269(33), 20952-20957, 1994). This substrate was selected because it has a balanced hydrolysis rate against MMPs 2 and 9 (k_{cat} / k_m of 54,000, 59,400 and 55,300 s⁻¹ M⁻¹ respectively). The final substrate concentration used in the assay was 5μM.

10 (iii) Determination of Enzyme Inhibition

Test compounds were dissolved in dimethyl sulphoxide and diluted with test buffer solution (as above) so that no more than 1% dimethyl sulphoxide was present. Test compound and enzyme were added to each well of a 96 well plate and allowed to equilibrate for 15 minutes at 37°C in an orbital shaker prior to the addition of substrate. Plates were then incubated for 1 hour at 15 37°C prior to determination of fluorescence using a fluorimeter (Fluostar; BMG LabTechnologies, Aylesbury, UK) at an excitation wavelength of 328nm and emission wavelength of 393nm. The potency of inhibitors was measured from the amount of substrate cleavage obtained using a range of test compound concentrations, and, from the resulting dose-response curve, an IC₅₀ value (the concentration of inhibitor required to inhibit 50% of the 20 enzyme activity) was calculated.

Inhibition of MMP-14

(i) Enzyme Preparation

25 Catalytic domain MMP-14 was purchased from Prof. Tschesche, Department of Biochemistry, Faculty of Chemistry, University of Bielefeld, Germany. A 10μM enzyme stock solution was activated for 20 minutes at 25°C following the addition of 5μg/ml of trypsin (Sigma, Dorset, UK). The trypsin activity was then neutralised by the addition of 50μg/ml of soyabean trypsin inhibitor (Sigma, Dorset, UK), prior to dilution of this enzyme stock solution in Tris-HCl assay buffer 30 (100mM Tris, 100mM NaCl, 10mM CaCl₂ and 0.16% Brij 35, pH 7.5) to a concentration of 10nM. The final concentration of enzyme used in the assay was 1nM.

(ii) Substrate

The fluorogenic substrate used in this screen was Mca-Pro-Leu-Gly-Leu-Dpa-Ala-Arg-NH₂ 35 (Bachem Ltd, Essex, UK) as described by Will et al (J.Biol.Chem., 271(29), 17119-17123, 1996). The final substrate concentration used in the assay was 10μM.

Determination of enzyme inhibition by test compounds was performed in the same manner as described for MMPs-2 and -9 above.

All the compounds of the Examples had IC_{50} values vs PCP of 0.5 μ M or less.

- 5 The compounds of Examples 6, 17, and 72 had IC_{50} values vs PCP of 107nM, 98nM and 37nM respectively.

All references mentioned herein in this specification are incorporated by reference in their entirety.

10

The compounds of the invention are illustrated by the Examples below.

EXAMPLES AND PREPARATIONS

- 15 Melting points were determined using open glass capillary tubes and a Gallenkamp melting point apparatus and are uncorrected. Nuclear magnetic resonance (NMR) data were obtained using Varian Unity Inova-400, Varian Unity Inova-300 or Bruker AC300 spectrometers and are quoted in parts per million from tetramethylsilane. Mass spectral (MS) data were obtained on a Finnigan Mat. TSQ 7000 or a Fisons Instruments Trio 1000. The calculated and observed ions
- 20 quoted refer to the isotopic composition of lowest mass. Infra red (IR) spectra were measured using a Nicolet Magna 550 Fourier transform infra-red spectrometer. Flash chromatography refers to column chromatography on silica gel (Kieselgel 60, 230-400 mesh, from E. Merck, Darmstadt. Kieselgel 60 F₂₅₄ plates from E. Merck were used for TLC, and compounds were visualised using UV light, 5% aqueous potassium permanagate or Dragendorff's reagent
- 25 (oversprayed with aqueous sodium nitrite). Thermal analyses by Differential Scanning Calorimetry (DSC) and ThermoGravimetric Analysis (TGA) were obtained using Perkin Elmer DSC7 and TGA7. Moisture sorption characteristics were recorded using Surface Measurement Systems Ltd. Automated Water Sorption Analyser DVS 1. Water content was determined on a Mitsubishi CA100 (Coulometric Karl Fisher Titrator). Powder X-ray diffraction (PXRD) pattern
- 30 was determined using a Siemens D5000 powder X-ray diffractometer fitted with an automatic sample changer, a theta-theta goniometer, automatic beam divergence slits, a secondary monochromator and a scintillation counter. Other measurements were taken using standard equipment. Hexane refers to a mixture of hexanes (hplc grade) b.p. 65-70°C. "Ether" and "Et₂O" refers to diethyl ether. Acetic acid refers to glacial acetic acid. 1-Hydroxy-7-aza-1H-
- 35 1,2,3-benzotriazole (HOAt). "HOBt" is 1-hydroxy-1H-1,2,3-benzotriazole. N-[(dimethylamino)-1H-1,2,3-triazolo[4,5-b]pyridin-1-ylmethylene]-N-methylmethaninium hexafluorophosphate N-oxide (HATU) and 7-azabenzotriazol-1-yloxytris(pyrrolidino)phosphonium hexafluorophosphate (PyAOP) were purchased from PerSeptive Biosystems U.K. Ltd. "DIPE" refers to diisopropyl ether. Reverse-phase silica gel for flash chromatography was obtained from Fluka (Fluka 100,

C₁₈, 40-63μ). "DCM" is dichloromethane. "THF" is tetrahydrofuran. "WSCDI" is 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride. "CDI" is carbonyldiimidazole. "EtOAc" is ethyl acetate. "MeOH" is methanol. "DMSO" is dimethylsulphoxide. "ACE-Cl" is 1-chloroethyl chloroformate. "NMM" is N-methylmorpholine. "Pentane" refers to High Performance Liquid

- 5 Chromatography (HPLC) grade n-pentane (b.pt.35-37°C). Nomenclature has been allocated using the commercially available ACD program. Standard abbreviations are used throughout, e.g. "Me" is methyl, "Et" is ethyl, "Pr" is propyl, "Ph" is phenyl, etc.
- ^aHPLC autopurification performed using 2 columns - Phenomonex LUNA C8 150x21.2mm, 10μm and Phenomonex MAGELLEN C18 150x21.2mm, 5μm, eluting with a gradient system of
- 10 organic solvent [ammonium acetate (aq) 100mM : acetonitrile (1 : 9)] : aqueous solvent [ammonium acetate (aq) 100mM : acetonitrile (9 : 1)]

- ^b HPLC autopurification performed using 2 columns - Phenomonex LUNA C8 150x21.2mm, 10μm and Phenomonex MAGELLEN C18 150x21.2mm, 5μm, eluting with a gradient system of
- 15 organic solvent (acetonitrile) : aqueous solvent (0.1% aqueous trifluoroacetic acid)

Example 1:

- 20 (3*R*)-6-cyclohexyl-*N*-hydroxy-3-(3-[[[(methylsulfonyl)amino]methyl]-1,2,4-oxadiazol-5-yl]hexanamide

- 25 METHOD A. A solution of (3*R*)-6-cyclohexyl-3-(3-[[[(methylsulfonyl)amino]methyl]-1,2,4-oxadiazol-5-yl]hexanoic acid (preparation 4) (6.80g, 18.2mmol) and 2,6-lutidine (2.3ml, 20.0mmol) in THF (100ml) at 0°C, under a nitrogen atmosphere was treated with *i*-butyl chloroformate (2.6ml, 20.0mmol) and stirred at 0°C for 1.5hours. *o*-(trimethylsilyl)hydroxylamine (4.9ml, 40.0mmol) was added and the reaction mixture was stirred for 18 hours warming to
- 30 room temperature over this time. MeOH was added and the reaction mixture stirred for a further 2 hours. The solvent was removed under reduced pressure. The yellow solid was dissolved in EtOAc (400ml), washed with dilute HCl (150ml 2M HCl + 200ml H₂O) and brine, dried over

MgSO₄ and filtered. The solvent was removed under reduced pressure. The solid was recrystallised from hot EtOAc to afford the title compound as a white solid (4.74g, 67%).

METHOD B. CDI (7.6g, 47mmol) was added portionwise over 2 min to a solution of (3*R*)-6-cyclohexyl-3-(3-(((methylsulfonyl)amino)methyl)-1,2,4-oxadiazol-5-yl)hexanoic acid (preparation 4) (14.0g, 42mmol) in THF (160ml), at ambient temperature, under a nitrogen. The mixture was stirred at ambient temperature for 30 min and then cooled to 0°C. Aqueous hydroxylamine (50%, 13.1ml, 0.21mol) was added between 0 and 5°C and the reaction mixture was stirred for 18 hours warming to room temperature over this time. Aqueous citric acid solution (10%, 160ml) was added and the mixture was extracted with ethyl acetate (2x160ml). The combined organic fractions were washed with demineralised water (160ml) and then concentrated *in vacuo* to a colourless solid. Ethyl acetate (64ml) was added and the mixture was stirred at ambient temperature for 1 hour and then filtered. The residue was dried *in vacuo* at 45°C to afford the title compound as an off-white solid (14.2g, 85%).

25

METHOD C (Alternative Synthesis):
Ethyl chloroformate (0.11ml, 1.2mmol) was added to a stirred solution of (3*R*)-6-cyclohexyl-3-(3-(((methylsulfonyl)amino)methyl)-1,2,4-oxadiazol-5-yl)hexanoic acid (preparation 4) (0.40g, 1.1mmol) in THF (10ml) and ether (10ml) at 0 °C under a nitrogen atmosphere. The reaction was stirred at 0 °C for 40 minutes then aqueous hydroxylamine (80 µl of 50% solution by weight, 1.2 mmol) was added. The reaction was left to warm to room temperature overnight. The solvents were removed under reduced pressure, then the residue was dissolved in EtOAc (20ml) and washed with water (20ml) and brine (20 ml). The organic layer was dried (MgSO₄) and filtered. The solvent was removed under reduced pressure. The residue was triturated with pentane, the solid was collected by filtration to give a white solid (410 mg, 98%). HPLC analysis indicated 95.5% was the title compound, 2% starting material and 2.5% other unidentified products.

35

Example 2:

(3*R*)-6-cyclohexyl-*N*-hydroxy-3-(3-([methyl(methylsulfonyl)amino]methyl)-1,2,4-oxadiazol-5-yl)hexanamide

5

Method is the same as for Example 1 using (3*R*)-6-cyclohexyl-3-([methyl(methylsulfonyl)amino]methyl)-1,2,4-oxadiazol-5-yl)hexanoic acid (preparation 7) (225mg, 0.58mmol) as starting material.

- 10 Purification: The crude material was purified on a silica column eluting with a solvent gradient of DCM : MeOH (100 : 0) gradually changing to (97 : 3) to yield the title compound as sticky colourless gum (180mg, 77%)

- 15 ¹H nmr : (d₆DMSO) 0.80 (2H, m), 1.05-1.30 (8H, m), 1.50-1.70 (7H, m), 2.52 (2H, obs), 2.80 (3H, s), 2.93 (3H, s), 3.42 (1H, m), 4.44 (1H, m), 8.62 (1H, brs), 10.38 (1H, brs).

20 Example 37:

(3*R*)-6-cyclohexyl-3-(3-[[1-ethylpropyl]amino]methyl)-1,2,4-oxadiazol-5-yl)-*N*-hydroxyhexanamide

25

Method as for example 7 using (3*R*)-6-cyclohexyl-3-(3-[[1-ethylpropyl]amino]methyl)-1,2,4-oxadiazol-5-yl)hexanoic acid (preparation 85) as starting material.

Purification: Crude material purified on a silica column eluting with DCM : MeOH : NH₃ (97.5 : 2.5 : 0.25). The solid was recrystallised from Et₂O to afford the title compound as fluffy crystals (212mg).

5 M.Pt. : 102.7-104.3°C

¹H nmr : (d₆DMSO) 0.79 (8H, m+t), 1.00-1.20 (8H, m), 1.33 (4H, m), 1.50-1.75 (7H, m), 2.29 (1H, t), 2.40 (2H, m), 3.41 (1H, m), 3.74 (2H, s).

Example 38:

15 (3*R*)-6-cyclohexyl-3-{3-[(cyclopropylamino)methyl]-1,2,4-oxadiazol-5-yl}-*N*-hydroxyhexanamide

Method as for Example 7 using (3*R*)-6-cyclohexyl-3-{3-[(cyclopropylamino)methyl]-1,2,4-oxadiazol-5-yl}hexanoic acid (preparation 87) (300mg, 0.67mmol) as starting material.

Purification: Crude material purified on a silica column eluting with a solvent gradient of DCM : MeOH : NH₃ (97.5 : 2.5 : 0.25) gradually changing to (90 : 10 : 1). The material was dissolved in Et₂O and washed with H₂O (x5) and the organic extracts were concentrated under reduced pressure. The residue was dissolved in DCM, dried over anhydrous Na₂SO₄ and filtered. The solvent was removed under reduced pressure to afford the title compound (41mg).

25

Preparation 1: (1Z)-N-hydroxy-2-[(methylsulfonyl)amino]ethanimidamide

10 (a) N-(Cyanomethyl)methanesulfonamide (known compound, WO 92/02521)

15 N-methyl morpholine (1.12Kg, 11.1mol) was added dropwise over 30 min to a stirred suspension of aminoacetonitrile.hydrochloride (500g, 5.4mol) in dichloromethane (2.5litres), between 25 and 28°C. The mixture was stirred at ambient temperature for 30 min. Methanesulfonyl chloride (619g, 5.4mol) was added dropwise over 60 min, maintaining the temperature between 15 and 22°C. The mixture was stirred at ambient temperature for 45 min and then cooled to 12°C. The mixture was filtered and the filtrate concentrated *in vacuo* to a

20 brown suspension. Acetone (2 litres) was added and the mixture was cooled to 10°C and then filtered. Silica (1Kg) was added to the filtrate, which was then filtered through a plug of silica (1Kg). The residue was washed with acetone (2x2.5litres) and the combined filtrate was concentrated *in vacuo* to afford the title compound as a brown oil (725g, quantitative).

25

(b) (1Z)-N-hydroxy-2-[(methylsulfonyl)amino]ethanimidamide

30

METHOD A. A solution of 50% aqueous hydroxylamine (367g, 5.4mol) was added over 60 min to a solution of N-(cyanomethyl)methanesulfonamide (725g, 5.4mol) in EtOH (3.6litres), between 25 and 35°C. The mixture was stirred at ambient temperature for 60 min and then

cooled to 5°C. The mixture was filtered and the residue washed with EtOH (3x250ml) and then dried by suction overnight to afford the title compound as white crystals (781g, 87%).

Method B. A solution of *N*-(cyanomethyl)methanesulfonamide (WO 92/02521) (10.85g, 81.0mmol) in EtOH (370ml) was treated with hydroxylamine.HCl (5.63g, 81.0mmol) followed by a solution of aqueous NaOH (3.24g, 81.0mmol in 125ml) and stirred at room temperature, under a nitrogen atmosphere for 20 hours. The solvent was removed under reduced pressure. The solid was dissolved in hot EtOH and the solid NaCl was filtered off. A solid began to crystallise out after 1 hour. The solid was filtered off and washed with Et₂O to afford the title compound as white crystals (9.77g, 72%).

¹H nmr : (d₆DMSO) 2.87 (3H, s), 3.49 (2H, s), 5.22 (2H, brs), 7.09 (1H, brs), 9.00 (1H, s)

MS : 190 (MNa⁺)

CHN : Found: C21.46%; H5.41%; N24.58%; C₃H₉N₃O₃S. 0.1H₂O requires C21.32%; H5.49%; N24.87%

Preparation 2: *tert*-butyl (5*Z*,9*R*)-5-amino-9-(3-cyclohexylpropyl)-8-oxo-7-oxa-2-thia-3,6-diazaundec-5-en-11-oate 2,2-dioxide

Method A. Sodium (2*R*)-2-(2-*tert*-butoxy-2-oxoethyl)-5-cyclohexylpentanoate (Preparation 167) (18.68g, 58.4mmol) was partitioned between 10% citric acid solution (190ml) and EtOAc (190ml). The organic layer was washed with brine, dried over anhydrous MgSO₄, filtered and the solvent removed under reduced pressure to afford the free acid as a colourless oil. A solution of the free acid in DCM (185ml) was treated CDI (9.46g, 58.4mmol) and the reaction mixture was stirred at room temperature for 1.5 hours. (1*Z*)-*N*-hydroxy-2-[(methylsulfonyl)amino]ethanimidamide (preparation 1) (9.75g, 58.4mmol) was added portionwise but required the addition of DMF (50ml) to dissolve the solid. The reaction mixture was stirred at room temperature for 18 hours. The solvents were removed under reduced pressure. The residue was dissolved on EtOAc (500ml) and washed with water (2x500ml) and

brine, dried over anhydrous MgSO_4 , filtered and the solvent removed under reduced pressure to afford the title compound as a white solid (26.3g, ~100%).

METHOD B. Sodium (2*R*)-2-(2-*tert*-butoxy-2-oxoethyl)-5-cyclohexylpentanoate (Preparation 167) (50.0g, 0.16mol) was partitioned between 10% citric acid solution (500ml) and dichloromethane (500ml). The organic layer was separated, washed with demineralised water (500ml), and then dried by azeotropic distillation at constant volume of dichloromethane. The mixture was allowed to cool to ambient temperature and then CDI (25.3g, 0.16mol) was added portionwise over 2 min, under nitrogen. The mixture was stirred at ambient temperature for 30 min and then (1*Z*)-*N*-hydroxy-2-[(methylsulfonyl)amino]ethanimidamide (preparation 1) (26.1g, 0.16mol) was added in one portion. The mixture was stirred at ambient temperature for 18 hours and then filtered. The filtrate was washed with water (2x500ml), 10% aqueous citric acid solution (500ml) and water (500ml) and then concentrated *in vacuo* to afford the title compound as a white solid (58.3g, 83%).

Preparation 3:

tert-butyl (3*R*)-6-cyclohexyl-3-(3-[[[(methylsulfonyl)amino]methyl]-1,2,4-oxadiazol-5-yl])hexanoate

METHOD A. *tert*-butyl (5*Z*,9*R*)-5-amino-9-(3-cyclohexylpropyl)-8-oxo-7-oxa-2-thia-3,6-diazaundec-5-en-11-oate 2,2-dioxide (preparation 2) (26.0g, 58.2mmol) was heated at 130°C in xylene (500ml) under a nitrogen atmosphere for 20 hours. The crude reaction mixture was purified on a silica column diluted at first by pentane and eluting the column with a solvent gradient of DCM : MeOH (100 : 0) gradually changing to (90 : 10). Mixed fractions were combined and the solvent removed under reduced pressure to give a brown residue. This was triturated with pentane and the solid filtered off to afford the title compound as a white solid (9.43g, 38%).

METHOD B. A stirred suspension of *tert*-butyl (5*Z*,9*R*)-5-amino-9-(3-cyclohexylpropyl)-8-oxo-7-oxa-2-thia-3,6-diazaundec-5-en-11-oate 2,2-dioxide (preparation 2) (50.0g, 0.11mol) and basic aluminium oxide (150g) in toluene was heated to reflux for 5 hours, under nitrogen. Basic aluminium oxide (50g) was added and the mixture was held at reflux for a further 1 hour. The mixture was allowed to cool to ambient temperature and then filtered. The residue was washed with toluene (100ml) and the combined filtrate was concentrated *in vacuo* to afford the title compound as a white solid (24.0g, 50%).

MS : 452 (MNa⁺)

Alternative synthesis:

A solution of *tert*-butyl (3*R*)-3-[3-(aminomethyl)-1,2,4-oxadiazol-5-yl]-6-cyclohexylhexanoate (preparation 18) (1.0g, 2.85mmol) in pyridine (10ml) at 0°C was treated with methanesulphonylchloride (221μl, 2.85mmol) and stirred under a nitrogen atmosphere for 5 hours. The solvent was removed under reduced pressure. The residue was dissolved in ethyl acetate and washed with 1M HCl followed by brine. The organic extract was dried over anhydrous MgSO₄, filtered and the solvent removed under reduced pressure. The residue was purified on a silica column eluting with a gradient solvent system EtOAc : pentane (0 : 100) gradually changing to (35 : 65) to afford the title compound as a pale yellow oil (1.22g, 98%).

¹H nmr : (CDCl₃) 0.84 (2H, m), 1.10-1.35 (8H, m), 1.40 (9H, s), 1.60-1.80 (7H, m), 2.62 (1H, dd), 2.79 (1H, dd), 2.99 (3H, s), 3.42 (1H, m), 4.45 (2H, d), 4.82 (1H, s).

Preparation 4:

(3*R*)-6-cyclohexyl-3-(3-(((methylsulfonyl)amino)methyl)-1,2,4-oxadiazol-5-yl)hexanoic acid

5

METHOD A. A solution of *tert*-butyl (3*R*)-6-cyclohexyl-3-(3-(((methylsulfonyl)amino)methyl)-1,2,4-oxadiazol-5-yl)hexanoate (preparation 3) (9.36g, 21.8mmol) in toluene (100ml) was treated with TFA (50ml) and stirred under a nitrogen atmosphere, at room temperature for 20 hours. The solvent was removed under reduced pressure and azeotroped with EtOAc. The residue was dissolved in EtOAc (250ml) and washed with H₂O followed by brine. The organic layer was dried over anhydrous MgSO₄, filtered and the solvent was removed under reduced pressure. The solid was triturated with Et₂O, filtered off and dried under reduced pressure to afford the title compound as an off-white solid (7.06g, 87%).

10

METHOD B. Trifluoroacetic acid (48ml) was added in one portion to a stirred solution of *tert*-butyl (3*R*)-6-cyclohexyl-3-(3-(((methylsulfonyl)amino)methyl)-1,2,4-oxadiazol-5-yl)hexanoate (preparation 3) (24.0g, 56mmol) in toluene (120ml), under nitrogen. The mixture was stirred at ambient temperature for 20 hours and then concentrated *in vacuo* to a yellow oil. Toluene (100ml) was added and the mixture was filtered. The residue was washed with toluene (2x20ml) and then dried *in vacuo* at 45°C to afford the title compound as an off-white solid (16.4g, 78%).

CHN : Found: C47.18%; H6.25%; N14.33%; C₁₉H₂₉N₅O₅S. 1 HCl. 0.1 DCM requires C47.35%; H6.28%; N14.46%

Preparation 21:

1*H*-pyrazole-4-sulfonyl chloride

A mixture of 1*H*-pyrazole-4-sulfonic acid (J. Am. Chem. Soc.; 1955, 77, 6532) (1.0g, 4.0mmol) and phosphorous pentachloride (1.6g, 7.7mmol) were heated up to 180°C over the period of an hour. The mixture began to reflux but not fully molten. The reaction mixture was cooled to 130°C and toluene (5ml) was added and allowed to cool to room temperature with stirring. The white solid was filtered off. The filtrate solvent was removed under reduced pressure and azeotroped with toluene and DCM to afford the title compound as a colourless oil and impure.

Preparation 22:

tert-butyl (3*R*)-6-cyclohexyl-3-(3-(((1*H*-pyrazol-4-ylsulfonyl)amino)methyl)-1,2,4-oxadiazol-5-yl)hexanoate

5

Method as for Preparation 10 using *tert*-butyl (3*R*)-3-[3-(aminomethyl)-1,2,4-oxadiazol-5-yl]-6-cyclohexylhexanoate (preparation 18) (310mg, 0.88mmol) and 1*H*-pyrazole-4-sulfonyl chloride (preparation 21) (220mg, 1.32mmol) as starting materials.

10

Purification: The crude material was purified on a silica column eluting with a solvent gradient of DCM : MeOH (98 : 2) gradually changing to (90 : 10) to afford the title compound.

¹H nmr : (CDCl₃) does not integrate for the pyrrole protons

Preparation 29:

N-(2-cyanoethyl)methanesulfonamide

A solution of aminopropionitrile fumarate salt (6.0g, 47mmol) in 2M NaOH solution (40ml) was stirred at room temperature for 15 minutes. The reaction mixture extracted with DCM (50ml). The organic extract was dried over anhydrous Na₂SO₄ and filtered. The filtrate was treated pyridine (11ml, 136mmol) and methanesulphonyl chloride (3.9ml, 50mmol) and stirred under at nitrogen atmosphere for 18 hours. The solvent was removed under reduced pressure. The oil was dissolved in DCM and washed with 2M HCl (2x100ml) and saturated NaHCO₃ solution. All the product had been extracted into the aqueous washings. NaHCO₃ solution was acidified with conc. HCl and combined with the other acidic washes. The aqueous washes were reduced to ~50ml in volume and extracted with EtOAc. The organic extract was evaporated under reduced pressure to afford the title compound as a pink oil (2.1g, 30%).

Preparation 45:

tert-butyl (3*R*)-3-{3-[[[3-chloropropyl)sulfonyl]amino]-1,2,4-oxadiazol-5-yl}-6-cyclohexylhexanoate

Method as for preparation 10 using tert-butyl (3R)-3-[3-(aminomethyl)-1,2,4-oxadiazol-5-yl]-6-cyclohexylhexanoate (preparation 18) (200mg, 0.57mmol) and 3-chloropropanesulphonyl chloride (83µl, 0.68mmol) as starting materials and pyridine as the base.

Purification: The crude material was purified on a silica column eluting with pentane : Et₂O (1 : 1) to afford the title compound as a colourless oil (225mg, 93%).

¹H nmr : (CDCl₃) 0.83 (2H, m), 1.10-1.35 (8H, m), 1.40 (9H, s), 1.60-1.80 (7H, m), 2.28 (2H, m), 2.61 (1H, dd), 2.78 (1H, dd), 3.23 (2H, m), 3.42 (1H, m), 3.62 (2H, t), 4.45 (2H, d), 5.79 (1H, brs).

Preparation 46:

(3R)-6-cyclohexyl-3-[3-(1,1-dioxido-2-isothiazolidinyl)-1,2,4-oxadiazol-5-yl]hexanoic acid

Sodium metal (114mg, 5.00mmol) was added in portions to MeOH (10ml) at 0°C and stirred until all of the sodium had dissolved (~10 minutes). A solution of tert-butyl (3R)-3-[3-((3-chloropropyl)sulfonyl)amino]-1,2,4-oxadiazol-5-yl]-6-cyclohexylhexanoate (preparation 45) (245mg, 0.50mmol) in MeOH (3ml) was added to the reaction mixture and was stirred under a

nitrogen atmosphere for 3 days warming to room temperature over this time. The reaction was quenched with H₂O and the solvent removed under reduced pressure. The residue was diluted with water and acidified with 2M HCl (pH~3) and extracted with Et₂O followed by EtOAc. The organic extracts were combined, dried over anhydrous MgSO₄ and filtered. The solvent was removed under reduced pressure to afford the title compound as a colourless oil (203mg, 98%).

¹H nmr : (d₆-DMSO) 0.81 (2H, m), 1.00-1.25 (8H, m), 1.50-1.70 (7H, m), 2.21 (2H, m), 2.74 (2H, t), 3.26 (2H, t), 3.40 (1H, m), 4.21 (2H, s).

Preparations 48 and 49:

- 5 (3*R*)-3-[3-(((*tert*-butylamino)sulfonyl)amino)methyl)-1,2,4-oxadiazol-5-yl]-6-cyclohexylhexanoic acid and (3*R*)-3-(3-((aminosulfonyl)amino)methyl)-1,2,4-oxadiazol-5-yl)-6-cyclohexylhexanoic acid

10

Method as for preparation 11 using *tert*-butyl (3*R*)-3-[3-(((*tert*-butylamino)sulfonyl)amino)methyl)-1,2,4-oxadiazol-5-yl]-6-cyclohexylhexanoate (preparation 47) (171mg, 0.35mmol) as starting material.

- 15 Purification: The crude product was dissolved in EtOAc and washed with H_2O and brine. The organic extract was dried over anhydrous $MgSO_4$ and filtered. The solvent was removed under reduced pressure to afford a mixture of (3*R*)-3-[3-(((*tert*-butylamino)sulfonyl)amino)methyl)-1,2,4-oxadiazol-5-yl]-6-cyclohexylhexanoic acid and (3*R*)-3-(3-((aminosulfonyl)amino)methyl)-1,2,4-oxadiazol-5-yl)-6-cyclohexylhexanoic acid (130mg).

20

Taken on as a mixture to the following step (see Examples 16,17).

Preparation 50:

tert-butyl (3*R*)-3-[3-(acetamido)methyl]-1,2,4-oxadiazol-5-yl]-6-cyclohexylhexanoate

25

A solution of *tert*-butyl (3*R*)-3-[3-(aminomethyl)-1,2,4-oxadiazol-5-yl]-6-cyclohexylhexanoate (preparation 18) (219mg, 0.62mmol) in THF (10ml) was treated with AcCl (53μl, 0.75mmol) and stirred at room temperature for 1 hour. More AcCl (200μl) was added and stirred for a further hour. Sat. NaHCO₃ solution was added and the layers separated. The organic extract was washed with brine, dried over anhydrous Na₂SO₄ and filtered. The solvent was removed under reduced pressure to afford the title compound as a colourless oil (247mg, 100%).

¹H nmr : (CDCl₃) 0.83 (2H, m), 1.10-1.35 (8H, m), 1.40 (9H, s), 1.60-1.80 (7H, m), 2.03 (3H, s), 2.60 (1H, dd), 2.79 (1H, dd), 3.42 (1H, m), 4.58 (2H, d), 5.94 (1H, brs).

Preparation 66:

tert-butyl (3*R*)-6-cyclohexyl-3-[3-(((methylamino)carbonyl)amino)methyl]-1,2,4-oxadiazol-5-yl]hexanoate

5

A solution of *tert*-butyl (3*R*)-3-[3-(aminomethyl)-1,2,4-oxadiazol-5-yl]-6-cyclohexylhexanoate (preparation 18) (148mg, 0.42mmol) in MeCN (10ml) was treated with *N,N*-disuccinimidyl carbonate (130mg, 0.51mmol) and stirred at room temperature, under a nitrogen atmosphere for 4 hours. The solvent was removed under reduced pressure. The oil was dissolved in THF (5ml) and treated with MeNH₂ (2.0M in THF) (1.0ml) forming a white precipitate. The reaction mixture was stirred at room temperature for 2 days and filtered. The solvent was removed under reduced pressure. The oil was purified on a silica column eluting with a solvent gradient of DCM : MeOH (95 : 5) gradually changing to (90 : 10) to afford the title compound as a colourless oil (134mg, 78%).

MS : 403 (MNa^+)

Preparation 72:

(3*R*)-3-(3-amino-1,2,4-oxadiazol-5-yl)-6-cyclohexylhexanoic acid

25

A solution of *tert*-butyl (3*R*)-6-cyclohexyl-3-[3-(hydrazinocarbonyl)-1,2,4-oxadiazol-5-yl]hexanoate (preparation 71) (1.06g, 2.76mmol) in glacial AcOH (10ml) was treated with 2M HCl (10ml) and stirred at room temperature for 30 minutes. The reaction mixture was cooled to 0°C before being treated with a solution of NaNO₂ (278mg, in 5ml H₂O) making sure the temperature never rose above 5°C. The reaction mixture was stirred at 0°C for 30 minutes and then allowed to warm to room temperature before being heated at 85°C until the evolution of gas a finished. The reaction mixture was neutralised with sat. Na₂CO₃ solution and extracted with EtOAc. The organic extract was washed with brine and the solvent removed under reduced pressure. The residue was treated with TFA (4ml) and stirred at room temperature for 1 hour. The solvent was removed under reduced pressure and the residue azeotroped from toluene (x3) and DCM (x3) to afford the title compound as a foam (390mg, 50%).

30

Preparation 104:

tert-butyl (3*R*)-6-cyclohexyl-3-(3-(((4-methoxycyclohexyl)amino)methyl)-1,2,4-oxadiazol-5-yl)hexanoate

Method as for preparation 5 using *tert*-butyl (3*R*)-6-cyclohexyl-3-[3-(((4-methylphenyl)sulfonyl)oxy)methyl]-1,2,4-oxadiazol-5-yl]hexanoate (preparation 177) (500mg, 0.99mmol) and trans-4-methoxycyclohexanamine.HCl (490mg, 2.96mmol) as starting materials. Purification: A total of 3 silica columns were required to afford the title compound reasonably pure. First column eluted with DCM : MeOH (97 : 3), the second column eluted with DCM : MeOH (99 : 1) and the third column eluted with DCM : MeOH (98 : 2) to afford the title compound (160mg).

¹H nmr : (CDCl₃) 0.82 (2H, m), 1.10-1.30 (10H, m), 1.39 (9H, s), 1.40-1.80 (11H, m+H₂O), 1.85 (2H, m), 2.57 (1H, dd), 2.61 (2H, t), 2.79 (1H, dd), 3.23 (3H, s), 3.33 (1H, m), 3.42 (1H, m), 3.90 (2H, s). Evidence of the presence of the *cis*-isomer of the cyclohexanamine.

MS : 464 (MH⁺)

Preparation 105:

(3*R*)-6-cyclohexyl-3-[3-(((4-methoxycyclohexyl)amino)methyl)-1,2,4-oxadiazol-5-yl]hexanoic acid

Method as for preparation 75 using *tert*-butyl (3*R*)-6-cyclohexyl-3-[3-(((4-methoxycyclohexyl)amino)methyl)-1,2,4-oxadiazol-5-yl]hexanoate (preparation 104) (160mg) as starting material to afford the title compound (175mg).

^1H nmr : (CDCl_3) 0.82 (2H, m), 1.10-1.35 (8H, m), 1.40 (2H, m), 1.55-1.95 (11H, m), 2.06 (2H, m), 2.78 (1H, dd), 2.95 (1H, dd), 3.19 (1H, m), 3.31 (3H, s), 3.42 (2H, m), 4.21 (2H, d). Evidence of the presence of the cis-isomer of the cyclohexanamine.

5 MS : 408 (MH^+)

Preparation 106:

tert-butyl (3*R*)-6-cyclohexyl-3-(3-(((2-methoxy-2-oxoethyl)amino)methyl)-1,2,4-oxadiazol-5-yl)hexanoate

10

A solution of *tert*-butyl (3*R*)-3-[3-(aminomethyl)-1,2,4-oxadiazol-5-yl]-6-cyclohexylhexanoate (preparation 18) (200mg, 0.57mmol) in THF (2ml) was treated with methyl bromoacetate (55μl, 0.57mmol) and NMM (63μl, 0.57mmol) and stirred at room temperature, under a nitrogen atmosphere for 3 days. The reaction mixture was diluted with EtOAc and washed with H_2O followed by brine, dried over anhydrous MgSO_4 and filtered. The solvent was removed under reduced pressure. The crude material was purified on a silica column eluting with a solvent gradient of EtOAc : pentane (5 : 95) gradually changing to (50 : 50) to afford the title compound as a colourless oil (170mg, 70%).

^1H nmr : (CDCl_3) 0.83 (2H, m), 1.10-1.35 (9H, m), 1.39 (9H, s), 1.60-1.80 (6H, m), 2.61 (1H, dd), 2.79 (1H, dd), 3.40-3.50 (3H, m+s), 3.73 (3H, s), 3.95 (2H, s).

25 MS : 421 (M-H)

Preparation 107:

(3*R*)-6-cyclohexyl-3-(3-(((2-methoxy-2-oxoethyl)amino)methyl)-1,2,4-oxadiazol-5-yl)hexanoic acid

30

Method as for preparation 11 using *tert*-butyl (3*R*)-6-cyclohexyl-3-(3-((2-methoxy-2-oxoethyl)amino)methyl)-1,2,4-oxadiazol-5-yl)hexanoate (preparation 106) (198mg, 0.47mmol) as starting material.

Purification: The crude material was purified on a silica column eluting with a solvent gradient of DCM : MeOH : AcOH (100 : 0 : 0) gradually changing to (93 : 7 : 0.7) to afford the title compound as a pale yellow oil (137mg, 79%).

¹H nmr : (CDCl₃) 0.81 (2H, m), 1.10-1.35 (8H, m), 1.60-1.80 (7H, m), 2.79 (1H, brd), 2.90 (1H, m), 3.46 (1H, brs), 3.79 (3H, s), 3.86 (2H, brs), 4.26 (2H, brs).

tert-butyl (3*R*)-6-cyclohexyl-3-(3-(((tetrahydro-2*H*-pyran-4-ylamino)methyl)-1,2,4-oxadiazol-5-yl)hexanoate

Method as for preparation 5 using *tert*-butyl (3*R*)-6-cyclohexyl-3-{3-(((4-methylphenyl)sulfonyl]oxy)methyl)-1,2,4-oxadiazol-5-yl}hexanoate (preparation 177) (500mg, 0.99mmol) and 4-aminotetrahydro-4H-pyran.HCl (J. Med. Chem.; 1971, 14, 600-14) (400mg, 2.90mmol) as starting materials. Dissolving the solid in 2M NaOH solution with Dowex 50Wx4-

Purification: The crude material was purified on a silica column eluting with a solvent gradient of Et₂O : MeOH (100 : 0) gradually changing to (98 : 2) to afford the title compound (308mg)

¹H nmr : (CDCl₃) 0.83 (2H, m), 1.10-1.30 (8H, m), 1.35-1.55 (13H, s+m), 1.60-1.85 (7H, m), 2.60 (1H, dd), 2.72 (1H, m), 2.79 (1H, dd), 3.39 (2H, t), 3.42 (1H, m), 3.92 (4H, s+m).

MS : 436 (MH⁺)

Preparation 111:

(3*R*)-6-cyclohexyl-3-{3-[(tetrahydro-2*H*-pyran-4-ylamino)methyl]-1,2,4-oxadiazol-5-yl}hexanoic acid

Method as for preparation 11 using *tert*-butyl (3*R*)-6-cyclohexyl-3-{3-[(tetrahydro-2*H*-pyran-4-ylamino)methyl]-1,2,4-oxadiazol-5-yl}hexanoate (preparation 110) (313mg) as starting material. Purified on a silica column eluting with a solvent gradient of DCM : MeOH (95 : 5) gradually changing to (93 : 7) to afford the title compound (231mg).

¹H nmr : (CDCl₃) 0.84 (2H, m), 1.10-1.35 (8H, m), 1.60-1.75 (7H, m), 1.81 (2H, m), 2.00 (2H, m), 2.73 (1H, brd), 2.84 (1H, m), 3.28 (1H, m), 3.40 (3H, m), 4.05 (2H, d), 4.20 (2H, m).

Preparation 115:

20 (3*R*)-6-cyclohexyl-3-(3-(((1-ethyl-1*H*-pyrazol-5-yl)amino)methyl)-1,2,4-oxadiazol-5-yl)hexanoic acid

Method as for preparation 7 using *tert*-butyl (3*R*)-6-cyclohexyl-3-(3-[[[(1-ethyl-1*H*-pyrazol-5-yl)amino]methyl]-1,2,4-oxadiazol-5-yl])hexanoate (preparation 114) (45mg, 0.10mmol) as starting material to afford the title compound as a gum (38mg).

5 ^1H nmr : (CDCl_3) very broad.

MS : 390 (MH^+)

Preparation 116:

10 *tert*-butyl (2*S*)-2-cyano-1-pyrrolidinecarboxylate

A solution of oxalyl chloride (11.0ml, 0.126mol) and DMF (11.4ml, 0.138mol) in MeCN (170ml) was treated dropwise with a solution of N-Boc-L-proline amide (12.3g, 0.57mol) and pyridine (20.4ml, 0.253mol) in MeCN (30ml) at 0°C and stirred at this temperature for 15 minutes. The reaction mixture was diluted with EtOAc and washed with H_2O (x3). The organic extract was dried over anhydrous MgSO_4 and filtered. The solvent was removed under reduced pressure. The residue was purified on a silica column eluting with a solvent gradient of pentane : EtOAc (80 : 20) gradually changing to (60 : 40) to afford the title compound (7.40g, 66%).

15 ^1H nmr : (d_6DMSO) 1.40 (9H, s), 1.88 (2H, brs), 2.05-2.30 (2H, m), 3.21 (1H, m), 3.35 (1H, brs), 4.60 (1H, d).

25 MS : 214 (MNH_4^+)

Preparation 117:

tert-butyl (2*S*)-2-[(*Z*)-amino(hydroxyimino)methyl]-1-pyrrolidinecarboxylate

30

Method as for preparation 1 using *tert*-butyl (2*S*)-2-cyano-1-pyrrolidinecarboxylate (preparation 116) (1.96g, 10.0mmol) as starting material to afford the title compound as a white solid (1.63g)

¹H nmr : (d₆DMSO) 1.34 (9H, d), 1.65-2.00 (4H, m), 3.15-3.35 (2H, m+H₂O), 4.05 (0.5H, brs),
 4.19 (0.5H, brs), 5.19 (2H, brd), 8.91 (1H, brs).

Preparation 118:

tert-butyl (2*S*)-2-{5-[(1*R*)-1-(2-*tert*-butoxy-2-oxoethyl)-4-cyclohexylbutyl]-1,2,4-oxadiazol-3-yl}-1-pyrrolidinecarboxylate

Method as for preparation 2 using *tert*-butyl (2*S*)-2-[(*Z*)-amino(hydroxyimino)methyl]-1-pyrrolidinecarboxylate (preparation 117) (1.60g, 7.00mmol) as starting material. The crude material was taken onto the cyclisation using the method as preparation 3.

Purification: The crude material was purified on a silica column eluting with DCM to afford the title compound as a colourless oil (1.42g).

¹H nmr : (CDCl₃) 0.81 (2H, m), 1.10-1.50 (26H, m), 1.60-1.80 (6H, m), 1.85-2.10 (4H, m), 2.22 (1H, m), 2.59 (1H, dd), 2.79 (1H, dd), 3.41 (1H, m), 3.50-3.65 (2H, m), 4.91 (0.5H, brs), 5.03 (0.5H, brs).

MS : 492 (MH⁺)

Preparation 119:

(3*R*)-6-cyclohexyl-3-{3-[(2*S*)-pyrrolidinyl]-1,2,4-oxadiazol-5-yl}hexanoic acid

Method as for preparation 75 using *tert*-butyl (2*S*)-2-{5-[(1*R*)-1-(2-*tert*-butoxy-2-oxoethyl)-4-cyclohexylbutyl]-1,2,4-oxadiazol-3-yl}-1-pyrrolidinecarboxylate (preparation 118) (1.42g, 2.89mmol) as starting material to afford the title compound as a colourless oil.

¹H nmr : (d₆DMSO) 0.79 (2H, m), 1.05-1.30 (8H, m), 1.50-1.70 (7H, m), 2.01 (3H, m), 2.39 (1H, m), 2.78 (2H, d), 3.30 (2H, m), 3.42 (1H, m), 4.86 (1H, m).

MS : 336 (MH⁺)

Preparation 120:

(3*R*)-3-{3-[(2*S*)-1-(*tert*-butoxycarbonyl)pyrrolidinyl]-1,2,4-oxadiazol-5-yl}-6-cyclohexylhexanoic acid

A solution of (3*R*)-6-cyclohexyl-3-{3-[(2*S*)-pyrrolidinyl]-1,2,4-oxadiazol-5-yl}hexanoic acid (preparation 119) (1.30g, 3.88mmol) in dioxan (10ml) was treated with sat. NaHCO₃ solution (10ml) followed by Boc anhydride (1.00g, 4.59mmol) and stirred at room temperature for 18 hours. The reaction mixture was partitioned between EtOAc and 5% citric acid solution. The organic extract was dried over anhydrous MgSO₄ and filtered. The solvent was removed under reduced pressure. The residue was purified on a silica column eluting with pentane : EtOAc (70 : 30) to afford the title compound as a colourless gum (1.18g)

^1H nmr : (d_6DMSO) 0.79 (2H, m), 1.10-1.25 (8H, m+ $^t\text{BuOH}$ +EtOAc), 1.42 (9H, s), 1.50-1.70 (7H, m), 1.70-1.95 (3H, m), 2.22 (1H, m), 2.69 (2H, m), 3.38 (3H, m), 4.81 (1H, brs).

5 Preparation 121:

tert-butyl (2*S*)-2-[(*Z*)-amino{[(2*R*)-2-(2-*tert*-butoxy-2-oxoethyl)-5-cyclohexylpentanoyl]oxy}imino)methyl]-1-piperidinecarboxylate

10

A solution of (2*R*)-2-(2-*tert*-butoxy-2-oxoethyl)-5-cyclohexylpentanoic acid (preparation 168) (500mg, 1.67mmol) in DCM (20ml) was treated with HOBt (227mg, 1.67mmol), NMM (203μl, 1.85mmol) and WSCDI (354mg, 1.85mmol) followed by *tert*-butyl (2*S*)-2-[(*Z*)-amino(hydroxyimino)methyl]-1-piperidinecarboxylate (WO 9945006) (406mg, 1.67mmol) and stirred at room temperature, under a nitrogen atmosphere for 18 hours. H_2O (10ml) was added and after 10 minutes the reaction mixture was separated in a 5 micron filter cartridge. The solvent was removed under reduced pressure to afford the title compound as a colourless foam.

15

^1H nmr : (CDCl_3) 0.86 (2H, m), 1.10-1.30 (6H, m), 1.30-1.50 (20H, m+s+s), 1.50-1.70 (11H, m), 1.90 (1H, m), 2.30 (1H, brd), 2.41 (1H, dd), 2.68 (1H, dd), 2.80 (1H, brd), 2.89 (1H, m), 3.99 (1H, brd), 4.98 (1H, d), 5.17 (2H, brs).

Preparation 133:

[[[5-[(1*R*)-1-(2-*tert*-butoxy-2-oxoethyl)-4-cyclohexylbutyl]-1,2,4-oxadiazol-3-yl)methyl](methyl)amino]acetic acid

A solution of *tert*-butyl (3*R*)-6-cyclohexyl-3-{3-[[[2-ethoxy-2-oxoethyl](methyl)amino]methyl]-1,2,4-oxadiazol-5-yl}hexanoate (preparation 132) (1.00g, 2.21mmol) in dioxan (20ml) and H₂O (20ml) was treated with LiOH.H₂O (193mg, 2.21mmol) and the reaction mixture stirred at room temperature for 19 hours. The solvent was removed under reduced pressure. The residue was dissolved in EtOAc and washed with brine. The aqueous was extracted with EtOAc (x3). The combined organic extracts were dried over anhydrous Na₂SO₄ and filtered. The solvent was removed under reduced pressure to afford the title compound as a white foam (1.13g).

¹H nmr : (CDCl₃) 0.82 (2H, m), 1.05-1.30 (8H, m), 1.39 (9H, s), 1.55-1.80 (7H, m), 2.23 (3H, s), 2.61 (1H, dd), 2.82 (1H, dd), 3.04 (2H, s), 3.41 (1H, m), 3.75 (2H, s).

Preparation 152:

- 5 ethyl (4*S*)-2-[(1*R*)-1-(2-*tert*-butoxy-2-oxoethyl)-4-cyclohexylbutyl]-4,5-dihydro-1,3-oxazole-4-carboxylate

- 10 A solution of *tert*-butyl (3*R*)-6-cyclohexyl-3-([[(1*S*)-2-ethoxy-1-(hydroxymethyl)-2-oxoethyl]amino]carbonyl)hexanoate (preparation 151) (10.0g, 24.2mmol) in THF (80ml) was treated with Burgess reagent (6.34g, 26.6mmol) and heated at reflux for 1 hour. The reaction mixture was allowed to cool to room temperature and stored in a fridge for 3 days. The solvent was removed under reduced pressure. The crude material was purified on a silica column
- 15 eluting with a solvent gradient of pentane : EtOAc (100 : 0) gradually changing to (80 : 20) to afford the title compound as a colourless oil (9.26g, 97%).

¹Hnmr (CDCl₃) : 0.81 (2H, m), 1.10-1.35 (11H, m), 1.40 (9H, s), 1.45-1.70 (7H, m), 2.39 (1H, dd), 2.60 (1H, dd), 2.85 (1H, m), 4.20 (2H, m), 4.30-4.45 (2H, m), 4.66 (1H, dd).

MS: 396 (MH⁺)

Preparation 153:

ethyl 2-[(1*R*)-1-(2-*tert*-butoxy-2-oxoethyl)-4-cyclohexylbutyl]-1,3-oxazole-4-carboxylate

A suspension of CuBr_2 (20.88g, 93.5mmol) and HMTA (13.1g, 93.5mmol) in degassed DCM (250ml) was treated with DBU (14.0ml, 93.5mmol) and the dark solution formed was stirred in a water bath for 5 minutes. A solution of ethyl 4*S*-2-[(1*R*)-1-(2-*tert*-butoxy-2-oxoethyl)-4-cyclohexylbutyl]-4,5-dihydro-1,3-oxazole-4-carboxylate (preparation 152) (9.24g, 23.4mmol) in degassed DCM (30ml) was added dropwise to the reaction mixture and stirred at room temperature for a further 3 hours. The solvent was removed under reduced pressure. The residue was dissolved in EtOAc and washed with a 1 : 1 solution of $\text{NH}_3(\text{aq})$: NH_4Cl . The aqueous extract was washed with EtOAc (2x 380ml). The combined organic extracts were washed with 2M HCl (500ml), sat. NaHCO_3 (500ml) and brine (500ml). The organic extracts were dried over anhydrous MgSO_4 and filtered. The solvent was removed under reduced pressure. The crude material was purified on a silica column eluting with a solvent gradient of EtOAc : pentane (0 : 100) gradually changing to (25 : 75) to afford the title compound as colourless oil which formed needles on standing (7.39g, 80%).

$^1\text{Hnmr}$ (CDCl_3) : 0.81 (2H, m), 1.10-1.30 (8H, m), 1.39 (12H, t+s), 1.55-1.80 (7H, m), 2.58 (1H, dd), 2.79 (1H, dd), 3.38 (1H, m), 4.39 (2H, q), 8.09 (1H, s).

Preparation 154:

(3*R*)-6-cyclohexyl-3-[4-(ethoxycarbonyl)-1,3-oxazol-2-yl]hexanoic acid

Method as for preparation 11 using ethyl 2-[(1*R*)-1-(2-*tert*-butoxy-2-oxoethyl)-4-cyclohexylbutyl]-1,3-oxazole-4-carboxylate (preparation 153) (7.39g, 18.8mmol) as starting material to afford the title compound as a pale yellow oil (6.34g, 99%).

$^1\text{Hnmr}$ (CDCl_3) : 0.80 (2H, m), 1.05-1.30 (8H, m), 1.38 (3H, t), 1.55-1.80 (7H, m), 2.77 (1H, dd), 2.97 (1H, dd), 3.44 (1H, m), 4.38 (2H, q), 8.15 (1H, s).

Preparation 155:

ethyl 2-[(1*R*)-1-{2-[(benzyloxy)amino]-2-oxoethyl}-4-cyclohexylbutyl]-1,3-oxazole-4-carboxylate

Method as for preparation 56 using (3*R*)-6-cyclohexyl-3-[4-(ethoxycarbonyl)-1,3-oxazol-2-yl]hexanoic acid (preparation 154) (2.21g, 6.55mmol) and *o*-benzylhydroxylamine (1.05g, 6.55mmol) as starting materials.

Purification: The crude material was purified on a silica column eluting with a solvent gradient of pentane : EtOAc (100 : 0) gradually changing to (50 : 50) to afford the title compound as a colourless oil which solidified on standing (2.3g, 80%).

¹H nmr : (CDCl₃) 0.80 (2H, m), 1.10-1.30 (8H, m+EtOAc), 1.38 (3H, t), 1.55-1.75 (7H, m+H₂O), 2.41 (1H, brs), 2.65 (1H, brs), 3.45 (1H, brs), 4.39 (2H, q), 4.84 (2H, s), 7.37 (5H, s), 8.08 (1H, s), 8.50 (1H, brs).

Preparation 156:

(3*R*)-*N*-(benzyloxy)-6-cyclohexyl-3-(4-formyl-1,3-oxazol-2-yl)hexanamide

A solution of ethyl 2-((1*R*)-1-{2-[(benzyloxy)amino]-2-oxoethyl}-4-cyclohexylbutyl)-1,3-oxazole-4-carboxylate (preparation 155) (1.50g, 3.39mmol) in toluene (50ml) at -78°C was treated dropwise with DIBAL (1M in hexanes) (11.86ml, 11.86mmol) and stirred at this temperature for 30 minutes. MeOH (12ml) was added to quench the reaction and the reaction mixture allowed to warm to room temperature. Alternate portions of NaHCO₃ and MgSO₄ were added to the reaction mixture to form a white paste. EtOAc was added and the solid filtered off. The solvent

was removed under reduced pressure. The crude material was purified on a silica column eluting with a solvent gradient of EtOAc : pentane (1 : 1) gradually changing to (1 : 0) to afford the title compound as a colourless oil (605mg, 45%).

- 5 ^1H nmr : (CDCl_3) 0.80 (2H, m), 1.10-1.30 (8H, m+EtOAc), 1.55-1.70 (7H, m+ H_2O), 2.42 (1H, brs), 2.61 (1H, brs), 3.48 (1H, m+MeOH), 4.83 (2H, s), 7.35 (5H, s), 8.16 (1H, s), 8.43 (1H, brs), 9.81 (1H, brs).

10

Preparation 157:

(3*R*)-*N*-(benzyloxy)-6-cyclohexyl-3-{4-[(isopropylamino)methyl]-1,3-oxazol-2-yl}hexanamide

15

A solution of (3*R*)-*N*-(benzyloxy)-6-cyclohexyl-3-(4-formyl-1,3-oxazol-2-yl)hexanamide (preparation 156) (200mg, 0.50mmol) in DCM (10ml) was treated with isopropylamine (43 μ l, 0.50mmol) and stirred at room temperature for 15 minutes. $\text{NaHB}(\text{OAc})_3$ (170mg, 0.80mmol) and AcOH (29 μ l, 0.50mmol) were added and the reaction mixture stirred at room temperature for 1 hour. The reaction mixture was diluted with DCM and washed with sat. NaHCO_3 solution followed by brine. The organic extract was dried over anhydrous MgSO_4 and filtered. The solvent was removed under reduced pressure. The crude material was purified on a silica column eluting with a solvent gradient of DCM : MeOH : NH_3 (100 : 0 : 0) gradually changing to (95 : 5 : 0.5) to afford the title compound as a colourless oil (75mg, 32%).

Preparation 164: 3-(diethoxyphosphoryl)succinic acid 1-*tert*-butyl ester

20

25 Triethylphosphonoacetate (12.0Kg, 53.5 mol) was added over 30 minutes to a stirred solution of potassium *tert*-butoxide (7.20Kg, 64.2 mol) in THF (118 litres), between 0 and 5°C, under nitrogen. The mixture was warmed to 25-30°C where it was stirred for 1 hour and then added over 45 minutes to a solution of *tert*-butyl bromoacetate (11.5Kg, 59.0 mol) in THF (28 litres), between 0 and 5°C, under nitrogen. The mixture was stirred at 0-5°C for 1 hour and then

30 demineralised water (6.1 litres) and ethanol (30 litres) were added. A solution of potassium

hydroxide (4.2Kg, 75.0 mol) in demineralised water (84 litres) was then added over 2 hours, between -5 and 0°C. The mixture was stirred at -10°C for 16 hours and then a solution of citric acid (16.5Kg, 85.8 mol) in demineralised water (32 litres) was added. The mixture was concentrated *in vacuo* to a volume of 180 litres and then ethyl acetate (90 litres) was added.

- 5 The organic phase was separated and the aqueous phase was re-extracted with ethyl acetate (30 litres). The combined organic phases were washed with water (30 litres) and then stripped and replaced with cyclohexane by distillation at atmospheric pressure, at a constant volume of 72 litres. *tert*-Butylmethyl ether (18 litres) was added and the mixture was stirred at ambient temperature for 12 hours and then filtered. The residue was washed with a mixture of
 10 cyclohexane (16 litres) and *tert*-butylmethyl ether (3.6 litres) then dried *in vacuo* for 16 hours to give the title compound as a colourless solid (10.0Kg, 60% yield, 98% pure by HPLC).

¹H-NMR (CDCl₃) δ : 4.20-4.10 (4H, m), 3.49-3.36 (1H, m), 3.00-2.85 (1H, m), 2.72-2.60 (1H, m), 1.20 (9H, s), 1.37-1.27 (6H, m)

15

Preparation 165: (*E*)-2-[2-(*tert*-butoxy)-2-oxoethyl]-5-phenyl-2-pentenoic acid

- 20 A solution of 3-(diethoxyphosphoryl)succinic acid 1-*tert*-butyl ester (Preparation 164, 100g, 0.32mol) in THF (300ml) was added dropwise over 15 min to a stirred solution of potassium *tert*-butoxide (110g, 0.98mol) in THF (300ml), between -10 and -5°C, under nitrogen. The mixture was stirred at -10°C for 15 min and then a solution of hydrocinnamaldehyde (46.8g, 0.35mmol) in THF (100ml) was added dropwise over 15 min, between -13 and -8°C. The mixture was
 25 stirred at -10°C for 30 min and then a solution of citric acid (111g, 0.58mol) in demineralised water (500ml), and ethyl acetate (500ml), were added. The pH was adjusted to pH 4 with aqueous sodium hydroxide solution (50%) and the phases were separated. The aqueous fraction was washed with ethyl acetate (500ml) and the combined organic fractions were washed with saturated sodium bicarbonate solution (500ml), citric acid solution (10%, 500ml)
 30 and demineralised water (500ml) and then concentrated *in vacuo*. The resulting solid was slurried in cyclohexane (470ml) for 1 hour and then the mixture was filtered. The residue was washed with cyclohexane (2x50ml) and dried *in vacuo* to leave the title compound as a colourless solid (76g, 81% yield, 99% pure by HPLC).

MS : 289 [(M-H)]⁻

¹H-NMR (CDCl₃) δ : 7.33-7.16 (5H, m), 7.05 (1H, br t), 3.20 (2H, s), 2.89 (2H, br t), 2.50 (2H, br dd), 1.41 (9H, s)

5

Preparation 166: (*R*)-2-[2-(*tert*-butoxy)-2-oxoethyl]-5-phenylpentanoic acid cyclohexylamine salt

- 10 A stirred solution of cyclohexylamine (266ml, 2.32 mol), (*E*)-2-[2-(*tert*-butoxy)-2-oxoethyl]-5-phenyl-2-pentenoic acid (Preparation 165, 688g, 2.37 mol) and [(*S*)-2,2'-bis(diphenylphosphino)-1,1'-binaphthyl]chloro(*p*-cymene)ruthenium chloride (4.4g, 4.7 mmol) in methanol (6.9 litres) was heated to 60°C, under hydrogen (60p.s.i.), for 47 hours and then allowed to cool to room temperature (enantiomeric excess= 88%). The mixture was filtered through celite and then the
- 15 solvent was stripped and replaced with acetone by distillation at atmospheric pressure, at a constant volume of 4.2 litres. The resulting suspension was cooled to room temperature where it was stirred for 4 hours and then filtered. The residue was washed with acetone (2x 1 litre) and then dried *in vacuo* at 45°C for 16 hours to leave the title compound as a colourless solid (590g, 64% yield, enantiomeric excess=98.9%, 97% pure by HPLC).

20

¹H-NMR (CD₃OD) δ : 7.23-7.09 (5H, m), 3.05-2.98 (1H, m), 2.64-2.56 (3H, m), 2.53 (1H, dd, *J* 15.2, 7.2Hz), 2.23 (1H, dd, *J* 15.2, 7.2Hz), 2.00-1.97, (2H, m), 1.85-1.81 (2H, m), 1.72-1.20 (10H, m), 1.40 (9H, s)

- 25 Preparation 167: (*R*)-2-[2-(*tert*-butoxy)-2-oxoethyl]-5-cyclohexylpentanoic acid sodium salt

(*R*)-2-[2-(*tert*-Butoxy)-2-oxoethyl]-5-phenylpentanoic acid cyclohexylamine salt (Preparation 166, 6.8g, 17 mmol) and ethyl acetate (100ml) were added to an aqueous solution of citric acid (10%, 100ml) and the organic phase was separated and washed with water (100ml). *Iso*-propyl alcohol (20ml) and 5% rhodium on alumina (51.6g) were added and the mixture was stirred at room temperature, under hydrogen (10 atmospheres, 150p.s.i.) for 48 hours and then filtered through celite. To the filtrate was added a solution of sodium hydroxide (0.67g, 17 mmol) in water and the mixture was stripped and replaced with acetonitrile by distillation at atmospheric pressure to a volume of 30ml. The mixture was allowed to cool to room temperature where it was stirred for 24 hours. The mixture was cooled to 0°C and then filtered. The residue was washed with acetonitrile (2x 10ml) and then dried *in vacuo* at 45°C for 2 hours to leave the title compound as a colourless solid (3.8g, 69% yield, 95% pure by NMR).

¹H-NMR (CD₃OD) δ: 2.62-2.57 (1H, m), 2.53 (1H, dd, *J* 14.8, 7.2Hz), 2.23 (1H, dd, *J* 14.8, 7.2Hz), 1.76-1.18 (15H, m), 1.44 (9H, s), 0.93-0.82 (2H, m)

Preparation 168 : (2*R*)-2-[2-(*tert*-Butoxy)-2-oxoethyl]-5-cyclohexylpentanoic acid

Route A:

(2*R*)-2-[2-(*tert*-butoxy)-2-oxoethyl]-5-cyclohexylpentanoic acid

A solution of (2*R*)-2-[2-(*tert*-butoxy)-2-oxoethyl]-5-phenylpentanoic acid (Syn. Lett.; 1998; 637-639) (10.00g, 34.2mmol) in acetic acid (120ml) was treated with 5% Rhodium on alumina catalyst, pressurised to 60psi with hydrogen in a sealed vessel and stirred at room temperature for 17 hours. The mixture was filtered through a pad of Arbocel® and the solvent was removed from the filtrate under reduced pressure. The residue was azeotroped from toluene to afford the title compound (7.53g).

MS : 299 (MH⁺)

¹H-NMR (CDCl₃) δ : 2.80 (1H, m), 2.61 (1H, m), 2.38 (1H, m), 1.75-1.56 (7H, m), 1.55-1.04 (17H, m), 0.84 (2H, m).

Route B:**(4S)-4-Benzyl-3-(5-cyclohexylpentanoyl)-1,3-oxazolidin-2-one**

- 5 A solution of 5-cyclohexylpentanoic acid (63.50g, 345mmol) in N,N-dimethylformamide (0.5ml) and dichloromethane (350ml) was cooled to 5°C and treated dropwise with oxalyl chloride (31.6ml, 362mmol) over 30 minutes. The mixture was stirred at 0°C for 3 hours then the solvent was removed under reduced pressure to afford 5-cyclohexylpentanoyl chloride as a pale yellow solid (70.0g).
- 10 A solution of n-butyllithium (100ml, 250mmol, 2.5M in hexanes) was added via a cannula to a solution of (4S)-4-benzyl-1,3-oxazolidin-2-one (44.30g, 250mmol) in anhydrous tetrahydrofuran (400ml) at -78°C. The yellow solution was then stirred for 45 minutes. A solution of 5-cyclohexylpentanoyl chloride (55.5g, 275mmol) in tetrahydrofuran (100ml) was then added over 1 hour. The mixture was stirred at -78°C for 30 minutes then warmed to room temperature over 1 hour. The mixture was quenched with an aqueous solution of ammonium chloride (20% w/v, 400ml) and extracted with ethyl acetate. The layers were separated and the organic layer was washed with brine, dried over anhydrous sodium sulphate and the solvent removed under reduced pressure. The solid was recrystallised from hexane (500ml) to afford the title compound as a white solid (81.0g).

20

MS: 344 (MH⁺)

¹H-NMR (CDCl₃) δ : 7.41-7.13 (5H, m), 4.68 (1H, m), 4.27-4.02 (2H, m), 3.31 (1H, dd, J=16, 4Hz), 3.06-2.70 (3H, m), 1.81-1.53 (7H, m), 1.49-1.04 (8H, m), 0.88 (2H, m)

25

tert-Butyl 3-[[[(4S)-4-benzyl-2-oxo-1,3-oxazolidin-3-yl]carbonyl]-6-cyclohexylhexanoate

A solution of (4S)-4-benzyl-3-(5-cyclohexylpentanoyl)-1,3-oxazolidin-2-one (70.0g, 204mmol) in anhydrous tetrahydrofuran (650ml) was cooled to -70°C and treated dropwise with sodium hexamethyldisilazide (1M in tetrahydrofuran, 224ml, 224mmol) over 45 minutes. The mixture was stirred for a further 45 minutes before being treated with t-butylbromoacetate (31.6ml, 214mmol). This mixture was stirred at -70°C for 30 minutes then warmed to -30°C and quenched with an aqueous solution of ammonium chloride (20%w/v, 400ml) and warmed to room temperature. The mixture was extracted with ethyl acetate and the combined organic extracts were washed with brine, dried over anhydrous sodium sulphate and the solvent removed under reduced pressure. The solid was recrystallised from hexane to afford the title compound as a white solid (71.4g).

MS: 458(MH⁺)

¹H-NMR (CDCl₃) δ : 7.41-7.13 (5H, m), 4.66 (1H, m), 4.23-4.03 (3H, m), 3.35 (1H, dd, J=16, 4Hz), 2.95-2.68 (3H, m), 2.47 (1H, m), 1.80-1.07 (24H, m), 0.85 (2H, m)

2-[2-(tert-Butoxy)-2-oxoethyl]-5-cyclohexylpentanoic acid

A solution of tert-butyl 3-[[[(4S)-4-benzyl-2-oxo-1,3-oxazolidin-3-yl]carbonyl]-6-cyclohexylhexanoate (64.0g, 139.9mmol) in tetrahydrofuran : water (3:1, 800ml) was cooled to 5°C then treated sequentially with hydrogen peroxide (30%w/v water, 87ml, 769mmol) then lithium hydroxide hydrate (10.0g, 238mmol). The reaction was stirred for 1 hour then quenched by dropwise addition of an aqueous solution of sodium thiosulphate (500ml) keeping the

temperature below 20°C. The mixture was extracted with ethyl acetate (discarded) and the aqueous phase was acidified to pH 2 with solid citric acid and extracted with ethyl acetate. The combined organic phases were washed with brine, dried over anhydrous sodium sulphate and the solvent removed under reduced pressure. The residue was purified by column

- 5 chromatography on silica gel eluting with a gradient system of hexane : ethyl acetate (2 : 1) gradually changing to hexane : ethyl acetate (1 : 1) to afford the title compound (40.7g)

Route C:

3-(Diethoxyphosphoryl)succinic acid 1-tert-butyl ester

10

- 15 Triethylphosphonoacetate (102g, 0.45 mol) was added dropwise over 11 min to a stirred solution of potassium *tert*-butoxide (60g, 0.54 mol) in THF (500ml), at 0°C, under nitrogen. The mixture was stirred for 1 hour at 0°C and then dichloromethane (300ml) was added and the reaction mixture was warmed to 25-30°C. The mixture was stirred at 25-30°C for 1 hour and then added dropwise over 33 minutes to a solution of *tert*-butyl bromoacetate (96g, 0.49 mol) in
- 20 THF (500ml), at 0°C, under nitrogen. The mixture was stirred at 0-5°C for 2 hours and then a solution of citric acid (174g, 0.91 mol) in demineralised water (250ml) was added. The mixture was concentrated in vacuo to remove most of the THF and then toluene (750ml) was added. The organic phase was separated, washed with brine (2x150ml) and concentrated in vacuo to leave a colourless oil. The oil was taken up in ethanol and a solution of potassium hydroxide
- 25 (36.g, 0.64mol) in demineralised water (150ml) was added dropwise over 15 mins. The mixture was stirred at 0°C for 4 hours and then a solution of citric acid (158 g, 0.82 mol) in demineralised water (600ml), and toluene (600ml), were added. The organic phase was separated and the aqueous phase was re-extracted with toluene (600ml). The combined organic phases were washed with demineralised water (2x150ml) and concentrated in vacuo to
- 30 leave a white solid. Toluene (150ml) was added and the slurry was re-concentrated in vacuo to leave a white solid. The product was purified by crystallisation from *tert*-butylmethyl ether (300ml) and cyclohexane (600ml) to give the title compound as a solid (79g).

- 35 ¹H-NMR (CDCl₃) δ : 4.20-4.10 (4H, m), 3.49-3.36 (1H, m), 3.00-2.85 (1H, m), 2.72-2.60 (1H, m), 1.20 (9H, s), 1.37-1.27 (6H, m)

Alternative preparation:

Triethylphosphonoacetate (12.0Kg, 53.5 mol) was added over 30 minutes to a stirred solution of potassium *tert*-butoxide (7.20Kg, 64.2 mol) in THF (118 litres), between 0 and 5°C, under

nitrogen. The mixture was warmed to 25-30°C where it was stirred for 1 hour and then added over 45 minutes to a solution of *tert*-butyl bromoacetate (11.5Kg, 59.0 mol) in THF (28 litres), between 0 and 5°C, under nitrogen. The mixture was stirred at 0-5°C for 1 hour and then demineralised water (6.1 litres) and ethanol (30 litres) were added. A solution of potassium hydroxide (4.2Kg, 75.0 mol) in demineralised water (84 litres) was then added over 2 hours, between -5 and 0°C. The mixture was stirred at -10°C for 16 hours and then a solution of citric acid (16.5Kg, 85.8 mol) in demineralised water (32 litres) was added. The mixture was concentrated *in vacuo* to a volume of 180 litres and then ethyl acetate (90 litres) was added. The organic phase was separated and the aqueous phase was re-extracted with ethyl acetate (30 litres). The combined organic phases were washed with water (30 litres) and then stripped and replaced with cyclohexane by distillation at atmospheric pressure, at a constant volume of 72 litres. *tert*-Butylmethyl ether (18 litres) was added and the mixture was stirred at ambient temperature for 12 hours and then filtered. The residue was washed with a mixture of cyclohexane (16 litres) and *tert*-butylmethyl ether (3.6 litres) then dried *in vacuo* for 16 hours to give the title compound as a colourless solid (10.0Kg, 60%).

¹H-NMR (CDCl₃) δ : 4.20-4.10 (4H, m), 3.49-3.36 (1H, m), 3.00-2.85 (1H, m), 2.72-2.60 (1H, m), 1.20 (9H, s), 1.37-1.27 (6H, m)

(E)-2-[2-(*tert*-Butoxy)-2-oxoethyl]-5-phenyl-2-pentenoic acid

A solution of 3-(diethoxyphosphoryl)succinic acid 1-*tert*-butyl ester (100g, 0.32mol) in THF (300ml) was added dropwise over 15 min to a stirred solution of potassium *tert*-butoxide (110g, 0.98mol) in THF (300ml), between -10 and -5°C, under nitrogen. The mixture was stirred at -10°C for 15 min and then a solution of hydrocinnamaldehyde (46.8g, 0.35mmol) in THF (100ml) was added dropwise over 15 min, between -13 and -8°C. The mixture was stirred at -10°C for 30 min and then a solution of citric acid (111g, 0.58mol) in demineralised water (500ml), and ethyl acetate (500ml), were added. The pH was adjusted to pH 4 with aqueous sodium hydroxide solution (50%) and the phases were separated. The aqueous fraction was washed with ethyl acetate (500ml) and the combined organic fractions were washed with saturated sodium bicarbonate solution (500ml), citric acid solution (10%, 500ml) and demineralised water (500ml) and then concentrated *in vacuo*. The resulting solid was slurried in cyclohexane

(470ml) for 1 hour and then the mixture was filtered. The residue was washed with cyclohexane (2x50ml) and dried *in vacuo* to leave the title compound as a colourless solid (76g, 81%).

MS : 289 [(M-H)]⁻

¹H-NMR (CDCl₃) δ : 7.33-7.16 (5H, m), 7.05 (1H, br t), 3.20 (2H, s), 2.89 (2H, br t), 2.50 (2H, br dd), 1.41 (9H, s)

(R)-2-[2-(tert-Butoxy)-2-oxoethyl]-5-phenylpentanoic acid

A stirred solution of (E)-2-[2-(tert-butoxy)-2-oxoethyl]-5-phenyl-2-pentenoic acid (100g, 0.34mol), cyclohexylamine (39ml, 0.34mol) and [(S)-2,2'-bis(diphenylphosphino)-1,1'-binaphthyl]chloro(p-cymene)ruthenium chloride (0.64g, 0.69mmol) in methanol (1000ml) was heated to 60°C, under hydrogen (60p.s.i.), for 42 hours and then allowed to cool to room temperature. The mixture was filtered through celite and then concentrated in vacuo to a yellow solid which was purified by re-crystallisation from acetone (850ml). The resulting solid was partitioned between ethyl acetate (1200ml) and citric acid solution (10%, 1200ml) and the organic phase was separated, washed with demineralised water (1200ml) and concentrated in vacuo to leave the title compound as an oil (80g).

¹H-NMR (CDCl₃) δ : 7.30-7.17 (5H, m), 2.85-2.78 (1H, m), 2.66-2.58 (3H, m), 2.37 (1H, br dd), 1.75-1.51 (4H, m), 1.40 (9H, s)

Preparation of cyclohexylamine salt:

A stirred solution of cyclohexylamine (266ml, 2.32 mol), (*E*)-2-[2-(*tert*-butoxy)-2-oxoethyl]-5-phenyl-2-pentenoic acid (688g, 2.37 mol) and [(*S*)-2,2'-bis(diphenylphosphino)-1,1'-binaphthyl]chloro(*p*-cymene)ruthenium chloride (4.4g, 4.7 mmol) in methanol (6.9 litres) was heated to 60°C, under hydrogen (60p.s.i.), for 47 hours and then allowed to cool to room temperature (enantiomeric excess= 88%). The mixture was filtered through celite and then the solvent was stripped and replaced with acetone by distillation at atmospheric pressure, at a constant volume of 4.2 litres. The resulting suspension was cooled to room temperature where it was stirred for 4 hours and then filtered. The residue was washed with acetone (2x 1 litre) and then dried *in vacuo* at 45°C for 16 hours to leave the title compound as a colourless solid (590g, 64%, enantiomeric excess=98.9%).

¹H-NMR (CD₃OD) δ : 7.23-7.09 (5H, m), 3.05-2.98 (1H, m), 2.64-2.56 (3H, m), 2.53 (1H, dd, *J* 15.2, 7.2Hz), 2.23 (1H, dd, *J* 15.2, 7.2Hz), 2.00-1.97, (2H, m), 1.85-1.81 (2H, m), 1.72-1.20 (10H, m), 1.40 (9H, s)

(*R*)-2-[2-(*tert*-Butoxy)-2-oxoethyl]-5-cyclohexylpentanoic acid cyclohexylamine salt

(*R*)-2-[2-(*tert*-Butoxy)-2-oxoethyl]-5-phenylpentanoic acid cyclohexylamine salt (691g, 1.77 mol) and ethyl acetate (7.0 litres) were added to an aqueous solution of citric acid (10%, 6.3 litres) and the organic phase was separated, washed with water (7.0 litres) and concentrated *in vacuo* to a yellow oil. A solution of the oil and 5% rhodium on carbon (51.6g) in methanol (7.0 litres) was stirred at ambient temperature, under hydrogen (150p.s.i.) for 48 hours and then filtered through celite. To the filtrate was added cyclohexylamine (202ml, 1.77 mol) and the methanol solution was stripped and replaced with methylethyl ketone by distillation at atmospheric pressure, to a volume of 5.5 litres. The mixture was allowed to cool to ambient temperature where it was stirred for 48 hours and then filtered. The residue was washed with methylethyl ketone (2x 500ml) and then dried *in vacuo* at 45°C for 4 hours to leave the title compound as a colourless solid (495g, 71%).

¹H-NMR (CD₃OD) δ : 3.06-2.99 (1H, m), 2.63-2.56 (1H, m), 2.53 (1H, dd, *J* 15.2, 7.2Hz), 2.23 (1H, dd, *J* 15.2, 7.2Hz), 2.02-1.97 (2H, m), 1.77-1.15 (21H, m), 1.43 (9H, s), 0.93-0.82 (2H, m)

(R)-2-[2-(tert-Butoxy)-2-oxoethyl]-5-cyclohexylpentanoic acid

5

A solution of (R)-2-[2-(tert-butoxy)-2-oxoethyl]-5-phenylpentanoic acid (2.2g, 7.5mmol) and 5%Rh/C (0.22g) in methanol (220ml) was stirred at room temperature, under hydrogen (150p.s.i.) for 24 hours and then filtered through celite. The filtrate was concentrated in vacuo to leave the title compound as an oil (2.0g).

10

¹H-NMR (CDCl₃) δ : 2.82-2.76 (1H, m), 2.60 (1H, br dd), 2.37 (1H, br dd), 1.70-1.60 (6H, m), 1.51-1.30 (3H, m), 1.42 (9H, s), 1.23-1.11 (6H, m), 0.96-0.80 (2H, m)

Preparation 169 :

15 tert-Butyl (3R)-3-[[[(Z)-1-amino-2-ethoxy-2-oxoethylidene]amino]oxy]carbonyl]-6-cyclohexylhexanoate

20 A solution of (2R)-2-[2-(tert-butoxy)-2-oxoethyl]-5-cyclohexylpentanoic acid (Preparation 168) (7.53g, 25.2mmol) in 1,4-dioxane (175ml) was treated with 1-hydroxybenzotriazole hydrate (3.75g, 27.8mmol) and the mixture cooled to 0°C. N,N'-Dicyclohexylcarbodiimide (5.47g, 26.5mmol) was then added and the mixture was stirred for 3 hours being allowed to warm to room temperature over this time. The mixture was then filtered and washed with 1,4-dioxane

25 (2x50ml). The filtrate was then treated with sodium carbonate (4.01g, 37.8mmol) and ethyl 2-amino-2-(hydroxyimino)acetate (J.Org.Chem.;23; 1958; 1794) (3.33g, 25.2mmol). The resulting mixture was stirred at room temperature for 17 hours. The solvent was removed under reduced pressure and the residue was partitioned between ethyl acetate and water. The layers were

separated and the aqueous phase was extracted with ethyl acetate (x2). The combined organic layers were dried over anhydrous magnesium sulphate, filtered and the solvent removed under reduced pressure. The residue was purified by column chromatography on silica gel eluting with a gradient system of ethyl acetate : pentane (30 : 70) gradually changing to ethyl acetate :

5 pentane (50 : 50) to afford the title compound as a white solid (6.50g).

MS : 413 (MH⁺)

¹H-NMR (CDCl₃) δ : 5.71 (2H, br s), 4.39 (2H, q), 2.92 (1H, m), 2.67 (1H, dd), 2.44 (1H, dd),

Preparation 171:

30 tert-Butyl (3R)-6-cyclohexyl-3-([2-hydroxy-1-(methoxycarbonyl)propyl]amino)carbonyl hexanoate

An ice-cooled solution of (2R)-2-[2-(tert-butoxy)-2-oxoethyl]-5-cyclohexylpentanoic acid (Preparation 168) (6.40g, 21.45mmol) in dichloromethane (75ml) was treated sequentially with 1-hydroxybenzotriazole hydrate (3.19g, 23.60mmol), threonine methyl ester hydrochloride (4.00g, 23.60mmol), N,N-diisopropylethylamine (7.85ml, 45.10mmol) and 1-[3-(dimethylamino)propyl]-3-ethylcarbodiimide hydrochloride (4.52g, 23.58mmol) and the mixture was stirred for 17 hours being allowed to warm to room temperature over this time. The solvent was removed under reduced pressure and the residue was dissolved in ethyl acetate then washed sequentially with water, aqueous citric acid solution (10% w/v), a saturated aqueous sodium hydrogen carbonate solution and brine, dried over anhydrous magnesium sulphate, filtered and the solvent removed under reduced pressure. The residue was dissolved in diethyl ether (100ml) and treated with pentane (150ml) to produce a white precipitate. This was filtered off and washed with pentane to afford the title compound as a white powder (6.48g).

MS : 436 (MNa⁺)

¹H-NMR (CDCl₃) δ : 6.35 (1H, br d), 4.63 (1H, m), 4.26 (1H, m), 3.76 (3H, s), 2.73-2.53 (2H, m), 2.34 (1H, m), 1.73-1.56 (7H, m), 1.45-1.09 (20H, m), 0.84 (2H, m)

Preparation 172:

tert-Butyl (3R)-6-cyclohexyl-3-((1-(methoxycarbonyl)-2-oxopropyl)amino)pentanoate

A solution of tert-butyl (3R)-6-cyclohexyl-3-((2-hydroxy-1-(methoxycarbonyl)propyl)amino)pentanoate (Preparation 171) (6.48g, 15.69mmol) in dichloromethane (60ml) was treated with Dess-Martin periodinane [1,1,1-triacetoxy-1,1-dihydro-

1,2-benziodoxol-3(1H)-one] (7.32g, 17.26mmol) and the resulting mixture was stirred at room temperature under a nitrogen atmosphere for 1 hour. A solution of sodium thiosulphate (6g in 50ml water) and a saturated aqueous sodium hydrogen carbonate solution (50ml) were then added to the mixture which was stirred for a further 10 minutes. The layers were separated and the aqueous layer was extracted with dichloromethane. The combined organic layers were sequentially washed with water and brine, dried over anhydrous magnesium sulphate, filtered and the solvent removed under reduced pressure. The residue was purified by column chromatography on silica gel eluting with a gradient system of pentane : ethyl acetate (100:0 to 90:10) to afford the title compound as a colourless oil (4.86g)

MS : 412 (MH^+), 434 (MNa^+)

1H -NMR ($CDCl_3$) δ : 6.82 (1H, br d), 5.21 (1H, m), 3.78 (3H, s), 2.72-2.52 (2H, m), 2.40-2.25 (4H, m), 1.72-1.53 (7H, m), 1.45-1.04 (17H, m), 0.83 (2H, m)

Preparation 173:

Methyl 2-((1R)-1-[2-(tert-butoxy)-2-oxoethyl]-4-cyclohexylbutyl)-5-methyl-1,3-oxazole-4-carboxylate

A suspension of triphenylphosphine (9.49g, 36.18mmol), iodine (7.98g, 31.44mmol) and triethylamine (8.49ml, 60.75mmol) in tetrahydrofuran was cooled to $-78^\circ C$ then treated with tert-butyl (3R)-6-cyclohexyl-3-([1-(methoxycarbonyl)-2-oxopropyl]amino)carbonyl hexanoate (Preparation 172) (4.86g, 11.80mmol) over 15 minutes. The mixture was stirred at $-78^\circ C$ for 30 minutes then at $0-5^\circ C$ for 2 hours. The mixture was diluted with water and extracted with dichloromethane. The combined organic layers were dried over anhydrous magnesium sulphate, filtered and the solvent removed under reduced pressure. The residue was purified by column chromatography on silica gel eluting with a gradient system of ethyl acetate : pentane (0: 100 to 10:90) to afford the title compound as a colourless oil (2.92g).

MS : 394 (MH^+), 416 (MNa^+)

$^1\text{H-NMR}$ (CDCl_3) δ : 3.89 (3H, s), 3.29 (1H, m), 2.74 (1H, dd, $J=14$, 6Hz), 2.60-2.49 (4H, m), 1.79-1.54 (7H, m), 1.38 (9H, s), 1.31-1.05 (8H, m), 0.82 (2H, m)

5 Preparation 174:

(3R)-6-Cyclohexyl-3-[4-(methoxycarbonyl)-5-methyl-1,3-oxazol-2-yl]hexanoic acid

- 10 A solution of methyl 2-((1R)-1-[2-(tert-butoxy)-2-oxoethyl]-4-cyclohexylbutyl)-5-methyl-1,3-oxazole-4-carboxylate (Preparation 173) (2.92g, 7.43mmol) in anhydrous dichloromethane (15ml) was treated with trifluoroacetic acid (7.5ml) and the resulting mixture was stirred at room temperature under a nitrogen atmosphere for 24 hours. The solvent was removed under reduced pressure and the residue was azeotroped with dichloromethane (x3). The residue was
- 15 purified by column chromatography on silica gel eluting with a gradient system of ethyl acetate : pentane (0:100 to 40:60) to afford the title compound as a colourless oil (2.50g).

MS : 338 (MH^+), 360 (MNa^+)
